Actives**

Break the Cycle

Stop white mould infection in its tracks with a well-timed fungicide application. Breaking the disease cycle before it takes hold is a sure way to protect your crop when pods begin to establish.

White mould spores settle on senescing flower petals and absorb their nutrients to start the infection cycle. To achieve protection before this early stage of infection, consider choosing products with a strong systemic action profile.

Viatude™ fungicide delivers two unique and highly effective active ingredients that both move throughout the plant, even protecting stems that may be shadowed by leaves in the upper canopy during application. Combining the right product and the right timing ensures spores won't have a chance.

Selecting varieties with **HIGH TOLERANCE** to disease is a good management practice in locations that often encounter white mould.

Since no variety is completely resistant to white mould, particularly under severe disease pressure, Viatude™ fungicide offers **THE BEST PROTECTION** to complement your seed investment.

PROTECT YOUR CROPS POTENTIAL
