Production Agriscience Canada Company
P. O. Box 730
7398 Queen's Line
Chatham, Ontario
N7M 5L1
519-352-6350
PRECAUTIONS
• KEEP OUT OF REACH OF CHILDREN.
• Avoid breathing spray mist.
• Avoid contact with skin, eyes and clothing.
• Keep the container or bag away from water.
• Do not contaminate any body of water.
• Do not enter or allow others to enter treated areas during the restricted entry interval of 12 hours after application.

IMPORTANT
Injury to or loss of desirable trees or vegetation may result from failure to observe the following:

Do not apply, drain or flush equipment on or near desirable trees or other plants, or on areas where their roots may extend, or in locations where the chemical may be washed or moved into contact with their roots. Do not use on lawns, walks, driveways, tennis courts or similar areas. Prevent drift of spray to desirable plants. Do not contaminate any body of water, including irrigation water that may be used on other crops. Carefully observe sprayer clean-up instructions, as spray tank residue may damage crops other than soybeans.

DO NOT APPLY BY AIR.

APPLY CLASSIC™ HERBICIDE WITH A RECOMMENDED SURFACTANT.

Do not handle pesticides with bare hands. Chemical-resistant gloves significantly reduce hand exposure. Wear gloves for mixing/loading/cleanup operations and when making sprayer and nozzle repairs and adjustments. Do not use leather or cloth gloves. Wear coveralls, or long-sleeved shirt and long pants, for mixing, loading, and applying, and during clean-up and repair activities.

FIRST AID
IF IN EYES: Hold eye open and rinse slowly and gently with water for 15–20 minutes. Remove contact lenses, if present, after the first 5 minutes, then continue rinsing eye. Call a poison control centre or doctor for treatment advice.
IF ON SKIN OR CLOTHING: Take off contaminated clothing. Rinse skin immediately with plenty of water for 15–20 minutes. Call a poison control centre or doctor for treatment advice.
IF SWALLOWED: Call a poison control centre or doctor immediately for treatment advice. Have person sip a glass of water if able to swallow. Do not induce vomiting unless told to do so by a poison control centre or doctor. Do not give anything by mouth to an unconscious person.
IF INHALED: Move person to fresh air. If person is not breathing, call 911 or an ambulance, then give artificial respiration, preferably by mouth-to-mouth, if possible. Call a poison control centre or doctor for further treatment advice.

Take container, label or product name and Pest Control Product Registration Number with you when seeking medical attention.

For medical emergencies call 1-800-441-3637 (24 hours).

TOXICOLOGICAL INFORMATION: Treat symptomatically

STORAGE
Store product in original container in a secure, dry area away from food or feed. Not for use or storage in or around the home. Keep container tightly closed. Keep product in original container or bag away from moisture.
DISPOSAL
1. Triple-or pressure-rinse the empty container. Add the rinsings to the spray mixture in the tank.
2. Follow provincial instruction for any required additional cleaning of the container prior to its disposal.
3. Make the empty container unsuitable for further use.
4. Dispose of the empty container in accordance with provincial requirements.

For information on the disposal of unused, unwanted product, contact the manufacturer or the provincial regulatory agency. Contact the manufacturer and the provincial regulatory agency in case of a spill, and for clean up of spills.

NOTICE TO USER
This pest control product is to be used only in accordance with the directions on the label. It is an offence under the PEST CONTROL PRODUCTS ACT to use this product in a way that is inconsistent with the directions on the label. The user assumes the risk to persons or property that arises from any such use of this product.

GENERAL INFORMATION
Classic Herbicide is recommended for selective postemergence control of broadleaf weeds in soybeans. Classic Herbicide can also be applied pre plant or post plant preemergence to soybeans, either conventional or glyphosate tolerant. Classic Herbicide is formulated as a dry flowable granule to be mixed in water and applied as a uniform broadcast spray. It is noncorrosive, nonflammable, nonvolatile, and does not freeze. Keep product away from excess moisture or physical damage during storage and prior to mixing in the spray tank. Do not reuse container or bag.

Classic Herbicide can be applied with a recommended surfactant either as a pre plant or post plant preemergence application to soybeans, either conventional or glyphosate tolerant, or early post-emergence to soybeans when the main flush of weeds are actively growing. Warm, moist growing conditions promote active weed growth and enhance the activity of Classic Herbicide by allowing maximum foliar uptake and contact activity. Weeds hardened off by environmental stress may not be adequately controlled and regrowth may occur. Classic Herbicide may only be applied using ground equipment. For best results, ensure thorough spray coverage of target weeds.

Classic Herbicide rapidly stops growth of susceptible weeds. However, typical symptoms (discoloration) of dying weeds may not be noticeable for 1 to 3 weeks after application, depending on growing conditions and weed susceptibility. Favourable growing conditions following treatment promote the activity of Classic Herbicide while cold, dry conditions delay the activity.

Degree of control and duration of effect depend on weed sensitivity, weed size, crop competition, growing conditions and spray coverage.

ENVIRONMENTAL CONDITIONS AND BIOLOGICAL ACTIVITY
The following precautions are recommended for application of Classic Herbicide on soybean.

Classic Herbicide applications made during or immediately following a large and rapid fluctuation in temperature (20°C or greater difference between night time lows and daytime highs) which stresses the crop may increase the potential for crop injury.

Apply Classic Herbicide when temperature is expected to be below 28 degrees C within 12 hours of application.

Apply when the minimum temperature in the 24 hours before and after application is above 5 degrees C. If soybeans have been injured by frost, wait at least 48 hours before applying the herbicide(s).
DIRECTIONS FOR USE

RATES AND TIMING
For the season long control of dandelion (up to bolting) apply 36 g/ha of Classic Herbicide, plus Agral 90 at 0.2% v/v, pre plant or post plant pre-emergence to soybeans, either in conventional or glyphosate tolerant.

Optimum timing of Classic Herbicide for annual broadleaf weed control in soybeans is from pre-plant to the 3 trifoliate stage of growth. Do not apply Classic Herbicide after the initiation of flowering. Classic Herbicide can be applied up to 60 days before harvest.

Use 36 grams of Classic Herbicide per hectare. A non-ionic surfactant such as Agral 90, Citowett Plus, or Ag-Surf must also be used at 0.2% v/v. OPTIONAL: The addition of liquid fertilizer containing 28% nitrogen to the spray mixture at the rate of 2 litres per hectare may improve control of velvetleaf and should be added after the surfactant.

For best results, apply to young actively growing weeds before the soybean canopy closes. Weeds that emerge after treatment may not be controlled.

NOTE: Do not apply to soybeans that have been stressed by severe weather conditions such as frost or hot, humid weather as crop injury may result.

If rain occurs after application, control may be reduced. Two - four hours of dry weather are needed to allow Classic Herbicide to be absorbed by weed foliage.

CLASSIC HERBICIDE TANK MIXES

Post-emergence tank-mix with Imazethapyr
Apply Classic Herbicide at 24 grams per hectare, tank-mixed with Imazethapyr 240 SL at 208 ml per hectare or Imazethapyr 75 WDG at 66.7 grams per hectare for the control of yellow nutsedge, eastern black nightshade and lamb's-quarters, when soybeans are in the 1 to 3 trifoliate stage of growth. Do not apply before the first trifoliate has fully expanded or after the initiation of flowering. This tank mix can be applied up to 100 days before harvest.

A non-ionic surfactant such as Agral 90, Citowett Plus, or Ag-Surf must also be used at 0.2% v/v. For post-emergent use on glyphosate tolerant soybeans tank-mix with glyphosate (present as potassium salt, isopropylamine salt, or di-ammonium salt) at 900 grams active per hectare. When Classic and Imazethapyr are tank mixed with a glyphosate herbicide, a non-ionic surfactant is not required.

Glyphosate tank-mix
Apply Classic Herbicide at 36 grams per hectare, tank mixed with glyphosate (present as potassium salt, isopropylamine salt, or di-ammonium salt) and adjuvant (where required).

CLASSIC HERBICIDE + METRIBUZIN
Apply Classic Herbicide at 36 grams per hectare, tank mixed with a metribuzin-containing end use product listed below at 550 grams per hectare for residual season long control of Canada fleabane including glyphosate resistant biotypes in soybeans. This tankmix is to be applied pre-plant or post-plant preemergence. To ensure control of emerged Canada fleabane seedlings, tank-mix pre-plant applications with a burndown partner such as 2,4-D Ester or Eragon. Pre-plant applications tank mixed with 2,4-D Ester must be applied a minimum 7 days before planting soybeans. Classic Herbicide plus metribuzin can be applied with glyphosate if required.
Tank mix partners:
TriCor MX Herbicide
TriCor 75 DF Herbicide
Lexone DF Herbicide
Sencor 75 DF Herbicide

Consult the respective glyphosate herbicide labels for specific instructions for ‘Directions for Use’, Precautions, and for other weeds controlled by glyphosate herbicide.

In some cases, tank mixing a pest control product with another pest control product or a fertilizer can result in biological effects that could include, but are not limited to: reduced pest efficacy or increased host crop injury. The user should contact Production Agriscience Canada Company at 1-800-667-3852 for information before mixing any pesticide or fertilizer that is not specifically recommended on this label. The user assumes the risk of losses that result from the use of tank mixes that do not appear on this label or that are not specifically recommended by Production Agriscience Canada Company.

If rain occurs after application, control may be reduced. Two - four hours of dry weather are needed to allow Classic Herbicide to be absorbed by weed foliage.

WEEDS CONTROLLED BY CLASSIC HERBICIDE + ASSURE II HERBICIDE
For the control of Annual Grasses, Common Ragweed, Redroot Pigweed and Velvetleaf, apply a tank mixture of Classic Herbicide + Assure II Herbicide. Use Classic Herbicide at 36 grams per hectare plus Assure II Herbicide at 0.38 to 0.5 litres per hectare. Add Canplus 411 at 1.0% v/v (1 litre per 100 litres of spray solution) or Sure-Mix at 0.5% v/v (0.5 litre per 100 litres of spray solution).

Use the 0.5 litre per hectare rate of Assure II Herbicide when quackgrass and yellow foxtail are present in the field. The tank mix of Classic Herbicide and Assure II Herbicide may result in reduced control of these two grassy weeds

Consult the Assure II Herbicide label for specified rates and optimum leaf stage timing for grassy weeds. If leaf stages of the grass and broadleaf weeds do not coincide, a sequential application of the grass and broadleaf herbicides is required to ensure satisfactory control.

Consult the Assure II label for general information and use precautions.

NOTE TO USER: READ THE FOLLOWING BEFORE USING THIS PRODUCT
FOR THE INDICATED SPECIAL USE APPLICATIONS:
The DIRECTIONS FOR USE for this product for the uses described below were developed by persons other than Production Agriscience Canada Company and accepted for registration by Health Canada under the User Requested Minor Use Label Expansion program. Production Agriscience Canada Company, itself makes no representation or warranty with respect to product performance (efficacy) and crop tolerance (phytotoxicity) claims for this product when used on the crops listed below.

Accordingly, the Buyer and User assume all risks related to performance and crop tolerance arising, and agree to hold Production Agriscience Canada Company harmless from any claims based on efficacy or phytotoxicity in connection with the uses described below.

SOYBEANS (Eastern Canada)
POSTEMERGENCE: Apply 36 g/ha Classic Herbicide + 0.2% v/v of a non-ionic surfactant + 2 L/ha liquid nitrogen fertilizer at 28% UAN for the suppression of wild carrot (Daucus carota) and volunteer adzuki beans (Vigna angularis Ohwi & Ohashi). Make only one application per year. Apply to soybeans in the 1-3 trifoliate stage of growth; apply to wild carrot when in the 2-20 leaf stage of growth and apply to volunteer adzuki beans when in the 1-3 trifoliate stage of growth.
Apply in a spray volume of 140-190 L water/ha.

Do not apply within 60 days of harvest.

Refer to other sections of this label for additional application instructions, soil limitations and/or use precautions. The addition of liquid fertilizer containing 28% nitrogen to the spray mixture at the rate of 2 L/ha is required for the suppression of volunteer adzuki beans and wild carrots and it may also improve control of velvetleaf.

**MIXING INSTRUCTIONS**

1. Fill clean tank about 1/4 full with fresh water.
2. Turn on full agitation.
3. Add the proper amount of Classic Herbicide to the water in the spray tank with the agitator running. Maintain full agitation until product is fully dispersed. Continuous agitation is required to keep the product in suspension.
4. After Classic Herbicide has been well mixed and is in suspension, add the tank mix partner, if applicable.
5. Add a recommended amount of spray adjuvant (if required).
6. Fill the remainder of the spray tank with clean water.

On repeat tank loads, ensure that the amount of spray solution left in the tank from the previous load is less than 10% of the volume about to be mixed.

Agitation is required for uniform mixing and application. The optimum water volume for Classic Herbicide application is 140-190 litres of water per hectare (minimum of 100 litres of water per hectare). Flat fan nozzles are recommended. Use 50 mesh filter screens or larger. Use spray preparation of Classic Herbicide within 24 hours or product degradation may occur resulting in a loss of weed control. Use vigorous agitation to thoroughly disperse spray mixtures that have been allowed to stand in the tank.

**NOTE:** Classic Herbicide will degrade in acidic or highly alkaline water. Mix no more than can be used in one day. If spraying is interrupted, thoroughly re-agitate the spray mixture before resuming spraying.

Do not mix or load where there is potential to contaminate wells or aquatic systems.

**SPRAYER CLEANUP**

To avoid subsequent injury to crops other than soybeans immediately after spraying and prior to spraying other crops, thoroughly remove all traces of Classic Herbicide from mixing and spray equipment as follows:

1. Drain tank; then flush tank, boom and hoses with clean water for a minimum of ten minutes. Visually inspect tank to assure removal of all visible residues of Classic Herbicide. If necessary, repeat step 1. **DO NOT CLEAN SPRAY EQUIPMENT NEAR WELLS, AQUATIC SYSTEMS, OR OTHER WATER SOURCES, OR NEAR DESIRABLE VEGETATION.**
2. Fill tank with clean water while adding 1 litre household ammonia (containing a minimum 3% ammonia) per 100 litres of water. Flush solution through boom and hoses, and then add more water to completely fill tank. Allow to sit for 15 minutes with agitation. Again flush the hoses, boom and nozzles with the cleaning solution and drain tank.
3. Remove the nozzles and screens and clean separately in a bucket containing cleaning agent and water.
4. Repeat Step 2.
5. Thoroughly rinse the tank with clean water for a minimum of 5 minutes, flushing water through the hoses and boom.

**REPLANTING TO OTHER CROPS**
Classic Herbicide is degraded by natural soil processes, and field tests have shown that the following crops may safely be planted at the prescribed interval following soybeans that have been treated with Classic Herbicide. The recropping intervals are dependent on the pH of the soil, as well as the sensitivity of the specific rotational crop.

* Warning: Sweet corn varieties may vary in their sensitivity to chlorimuron ethyl residues. Soil pH may vary significantly within a single field. It may be affected by soil amendments (i.e. lime, fertilizers, etc.) or soil conditions (i.e. eroded knolls, etc.).

For other crops, a field bioassay is recommended before planting. A successful field bioassay means growing to maturity a test strip of the crop(s) intended for production the following year.

FIELD BIOASSAY

Select a representative area or areas of the field previously treated with Classic Herbicide to plant your bioassay crop(s). Be sure to consider factors such as size of field, soil texture, drainage and turn-around areas when selecting the site(s) that are most representative of the soil conditions in the field. On large fields, more than one site may be needed in order to obtain reliable results.

Plant the test strips perpendicular to the direction in which the field was sprayed. The strips should be long enough to cross the width of several spray swaths. Large test strip areas are more reliable than small ones.

Use standard tillage and seeding equipment to plant the bioassay. Prepare a seed bed and plant the crops and varieties you want the option of growing the following year. It is important to use the same planting time, conditions, techniques and cultural practices you normally use to plant and grow the bioassay crop(s). Also plant into an adjacent area not treated with Classic Herbicide to use as a comparison.

As the crop(s) emerges and grows, examine these key points in Classic Herbicide treated and non-treated areas:

- crop stand
- root development
- rate of growth
- plant colour and vigour
- yield

Allow the bioassay crop(s) to grow to maturity while making your observations. Do not overspray the test strips with herbicides that may damage the bioassay crop(s). If the bioassay indicates that Classic Herbicide residues are still present, continue cropping only to those crops listed on the label and do not rotate to other crops until bioassay results indicate that susceptible crops are growing normally.

USE PRECAUTIONS

Do not apply Classic Herbicide during periods of intense rainfall or to soils saturated with water. Do not apply directly to standing or running water. Do not apply in areas where surface water from the treatment site can run off to adjacent cropland, either planted or to be planted, or into bodies of water (such as streams, ponds, rivers, lakes, and irrigation water), wetlands, or wells. Applications should only be made when there is no hazard of spray drift contaminating non-target land areas since very small quantities of the Classic Herbicide spray solution may severely injure susceptible crops and other sensitive terrestrial habitats during both growing and dormant periods.
Do not apply to soybeans that have been stressed by severe weather conditions, frost, low fertility, drought, water saturated soil, disease or insect damage as crop injury may result.

Under extreme weather conditions, such as hot, dry weather, excessive moisture, or frost, weed control may be reduced.

Rainfall within 4 hours after application of Classic Herbicide may reduce weed control.

Because soybean varieties differ in their tolerance to herbicides, limit first use of Classic Herbicide to a small area of each variety prior to adoption as a field practice.

Overspray or drift to important aquatic and terrestrial wildlife habitats should be avoided. Leave a 16 metre buffer zone between the last spray swath and bodies of water such as ponds, lakes, rivers, and streams. Leave a 39 metre buffer zone between the last spray swath and wetlands, vegetated areas at the edges of bodies of water, woodlots and shelterbelts, and other terrestrial wildlife habitats.

Classic Herbicide must not be applied within 60 days of harvest.

Make only one application of Classic Herbicide per season.

Do not graze the treated crop or cut for hay; sufficient data is not available to support such use.

Do not apply Classic Herbicide to soybean grown on soil of pH ≥ 8.0 due to risk of rotational crop injury.

**RESISTANCE-MANAGEMENT RECOMMENDATIONS**

For resistance management, Classic Herbicide is a Group 2 herbicide. Any weed population may contain or develop plants naturally resistant to Classic Herbicide and other Group 2 herbicides. The resistant biotypes may dominate the weed population if these herbicides are used repeatedly in the same field. Other resistance mechanisms that are not linked to site of action, but specific for individual chemicals, such as enhanced metabolism, may also exist. Appropriate resistance-management strategies should be followed.

To delay herbicide resistance:

- Where possible, rotate the use of Classic Herbicide or other Group 2 herbicides within a growing season (sequence) or among growing seasons with different herbicide groups that control the same weeds in a field.
- Use tank mixtures with herbicides from a different group when such use is permitted. To delay resistance, the less resistance-prone partner should control the target weed(s) as effectively as the more resistance-prone partner.
- Herbicide use should be based on an integrated weed management program that includes scouting, historical information related to herbicide use and crop rotation, and considers tillage (or other mechanical control methods), cultural (for example, higher crop seeding rates; precision fertilizer application method and timing to favour the crop and not the weeds), biological (weed-competitive crops or varieties) and other management practices.
- Monitor treated weed populations after herbicide application for signs of resistance development (for example, only one weed species on the herbicide label not controlled). If resistance is suspected, prevent weed seed production in the affected area if possible by an alternative herbicide from a different group. Prevent movement of resistant weed seeds to other fields by cleaning harvesting and tillage equipment when moving between fields, and planting clean seed.
- Have suspected resistant weed seeds tested by a qualified laboratory to confirm resistance and identify alternative herbicide options.
- Contact your local extension specialist or certified crop advisors for any additional pesticide resistance-management and/or integrated weed-management recommendations for specific crops and weed biotypes.
For further information or to report suspected resistance, contact your local Production Agriscience Canada Company representative or the Production Agriscience Canada Company hotline at 1-800-667-3852.

PRECAUTIONS
• KEEP OUT OF REACH OF CHILDREN.
• Avoid breathing spray mist.
• Avoid contact with skin, eyes and clothing.
• Keep the container or bag away from water.
• Do not contaminate any body of water.
• Do not enter or allow others to enter treated areas during the restricted entry interval of 12 hours after application.

IMPORTANT
Injury to or loss of desirable trees or vegetation may result from failure to observe the following:

Do not apply, drain or flush equipment on or near desirable trees or other plants, or on areas where their roots may extend, or in locations where the chemical may be washed or moved into contact with their roots. Do not use on lawns, walks, driveways, tennis courts or similar areas. Prevent drift of spray to desirable plants. Do not contaminate any body of water, including irrigation water that may be used on other crops. Carefully observe sprayer clean-up instructions, as spray tank residue may damage crops other than soybeans.

DO NOT APPLY BY AIR.

APPLY CLASSIC™ HERBICIDE WITH A RECOMMENDED SURFACTANT.

Do not handle pesticides with bare hands. Chemical-resistant gloves significantly reduce hand exposure. Wear gloves for mixing/loading/cleanup operations and when making sprayer and nozzle repairs and adjustments. Do not use leather or cloth gloves. Wear coveralls, or long-sleeved shirt and long pants, for mixing, loading, and applying, and during clean-up and repair activities.

FIRST AID
IF IN EYES: Hold eye open and rinse slowly and gently with water for 15–20 minutes. Remove contact lenses, if present, after the first 5 minutes, then continue rinsing eye. Call a poison control centre or doctor for treatment advice.
IF ON SKIN OR CLOTHING: Take off contaminated clothing. Rinse skin immediately with plenty of water for 15–20 minutes. Call a poison control centre or doctor for treatment advice.
IF SWALLOWED: Call a poison control centre or doctor immediately for treatment advice. Have person sip a glass of water if able to swallow. Do not induce vomiting unless told to do so by a poison control centre or doctor. Do not give anything by mouth to an unconscious person.
IF INHALED: Move person to fresh air. If person is not breathing, call 911 or an ambulance, then give artificial respiration, preferably by mouth-to-mouth, if possible. Call a poison control centre or doctor for further treatment advice.

Take container, label or product name and Pest Control Product Registration Number with you when seeking medical attention.

TOXICOLOGICAL INFORMATION: Treat symptomatically

STORAGE
Store product in original container in a secure, dry area away from food or feed. Not for use or storage in or around the home. Keep container tightly closed. Keep product in original container or bag away from moisture.

DISPOSAL
1. Triple-or pressure-rinse the empty container. Add the rinsings to the spray mixture in the tank.
2. Follow provincial instruction for any required additional cleaning of the container prior to its disposal.
3. Make the empty container unsuitable for further use.
4. Dispose of the empty container in accordance with provincial requirements.

For information on the disposal of unused, unwanted product, contact the manufacturer or the provincial regulatory agency. Contact the manufacturer and the provincial regulatory agency in case of a spill, and for clean up of spills.

NOTICE TO USER
This pest control product is to be used only in accordance with the directions on the label. It is an offence under the PEST CONTROL PRODUCTS ACT to use this product in a way that is inconsistent with the directions on the label. The user assumes the risk to persons or property that arises from any such use of this product.

GENERAL INFORMATION
Classic Herbicide is recommended for selective postemergence control of broadleaf weeds in soybeans. Classic Herbicide can also be applied pre plant or post plant preemergence to soybeans, either conventional or glyphosate tolerant. Classic Herbicide is formulated as a dry flowable granule to be mixed in water and applied as a uniform broadcast spray. It is noncorrosive, nonflammable, nonvolatile, and does not freeze. Keep product away from excess moisture or physical damage during storage and prior to mixing in the spray tank. Do not reuse container or bag.

Classic Herbicide can be applied with a recommended surfactant either as a pre plant or post plant pre-emergence application to soybeans, either conventional or glyphosate tolerant, or early post-emergence to soybeans when the main flush of weeds are actively growing. Warm, moist growing conditions promote active weed growth and enhance the activity of Classic Herbicide by allowing maximum foliar uptake and contact activity. Weeds hardened off by environmental stress may not be adequately controlled and regrowth may occur. Classic Herbicide may only be applied using ground equipment. For best results, ensure thorough spray coverage of target weeds.

Classic Herbicide rapidly stops growth of susceptible weeds. However, typical symptoms (discoloration) of dying weeds may not be noticeable for 1 to 3 weeks after application, depending on growing conditions and weed susceptibility. Favourable growing conditions following treatment promote the activity of Classic Herbicide while cold, dry conditions delay the activity.

Degree of control and duration of effect depend on weed sensitivity, weed size, crop competition, growing conditions and spray coverage.

ENVIRONMENTAL CONDITIONS AND BIOLOGICAL ACTIVITY
The following precautions are recommended for application of Classic Herbicide on soybean.

Classic Herbicide applications made during or immediately following a large and rapid fluctuation in temperature (20°C or greater difference between night time lows and daytime highs) which stresses the crop may increase the potential for crop injury.

Apply Classic Herbicide when temperature is expected to be below 28 degrees C within 12 hours of application.

Apply when the minimum temperature in the 24 hours before and after application is above 5 degrees C. If soybeans have been injured by frost, wait at least 48 hours before applying the herbicide(s).
DIRECTIONS FOR USE

RATES AND TIMING

For the season long control of dandelion (up to bolting) apply 36 g/ha of Classic Herbicide, plus Agral 90 at 0.2% v/v, pre plant or post plant pre-emergence to soybeans, either in conventional or glyphosate tolerant.

Optimum timing of Classic Herbicide for annual broadleaf weed control in soybeans is from pre-plant to the 3 trifoliate stage of growth. Do not apply Classic Herbicide after the initiation of flowering. Classic Herbicide can be applied up to 60 days before harvest.

Use 36 grams of Classic Herbicide per hectare. A non-ionic surfactant such as Agral 90, Citowett Plus, or Ag-Surf must also be used at 0.2% v/v. OPTIONAL: The addition of liquid fertilizer containing 28% nitrogen to the spray mixture at the rate of 2 litres per hectare may improve control of velvetleaf and should be added after the surfactant.

For best results, apply to young actively growing weeds before the soybean canopy closes. Weeds that emerge after treatment may not be controlled.

NOTE: Do not apply to soybeans that have been stressed by severe weather conditions such as frost or hot, humid weather as crop injury may result.

If rain occurs after application, control may be reduced. Two - four hours of dry weather are needed to allow Classic Herbicide to be absorbed by weed foliage.

*Top Growth Control (4 to 6 weeks)

CLASSIC HERBICIDE TANK MIXES

Post-emergence tank-mix with Imazethapyr
Apply Classic Herbicide at 24 grams per hectare, tank-mixed with Imazethapyr 240 SL at 208 ml per hectare or Imazethapyr 75 WDG at 66.7 grams per hectare for the control of yellow nutsedge, and eastern black nightshade, when soybeans are in the 1 to 3 trifoliate stage of growth. Do not apply before the first trifoliate has fully expanded or after the initiation of flowering. This tank mix can be applied up to 100 days before harvest.

A non-ionic surfactant such as Agral 90, Citowett Plus, or Ag-Surf must also be used at 0.2% v/v. For post-emergent use on glyphosate tolerant soybeans tank-mix with glyphosate (present as potassium salt, isopropylamine salt, or di-ammonium salt) at 900 grams active per hectare. When Classic and Imazethapyr are tank mixed with a glyphosate herbicide, a non-ionic surfactant is not required.

Glyphosate tank-mix
Apply Classic Herbicide at 36 grams per hectare, tank mixed with glyphosate (present as potassium salt, isopropylamine salt, or di-ammonium salt) and adjuvant (where required).

**CLASSIC HERBICIDE + METRIBUZIN**

Apply Classic Herbicide at 36 grams per hectare, tank mixed with a metribuzin-containing end use product listed below at 550 grams per hectare for residual season long control of Canada fleabane including glyphosate resistant biotypes in soybeans. This tankmix is to be applied pre-plant or post-plant preemergence. To ensure control of emerged Canada fleabane seedlings, tank-mix pre-plant applications with a burndown partner such as 2,4-D Ester or Eragon. Pre-plant applications tank mixed with 2,4-D Ester must be applied a minimum 7 days before planting soybeans. Classic Herbicide plus metribuzin can be applied with glyphosate if required.
Tank mix partners:
TriCor MX Herbicide
TriCor 75 DF Herbicide
Lexone DF Herbicide
Sencor 75 DF Herbicide

Consult the respective glyphosate herbicide labels for specific instructions for ‘Directions for Use’, Precautions, and for other weeds controlled by glyphosate herbicide.

In some cases, tank mixing a pest control product with another pest control product or a fertilizer can result in biological effects that could include, but are not limited to: reduced pest efficacy or increased host crop injury. The user should contact Production Agriscience Canada Company at 1-800-667-3852 for information before mixing any pesticide or fertilizer that is not specifically recommended on this label. The user assumes the risk of losses that result from the use of tank mixes that do not appear on this label or that are not specifically recommended by Production Agriscience Canada Company.

If rain occurs after application, control may be reduced. Two - four hours of dry weather are needed to allow Classic Herbicide to be absorbed by weed foliage.

WEEDS CONTROLLED BY CLASSIC HERBICIDE + ASSURE II HERBICIDE
For the control of Annual Grasses, Common Ragweed, Redroot Pigweed and Velvetleaf, apply a tank mixture of Classic Herbicide + Assure II Herbicide. Use Classic Herbicide at 36 grams per hectare plus Assure II Herbicide at 0.38 to 0.5 litres per hectare. Add Canplus 411 at 1.0% v/v (1 litre per 100 litres of spray solution) or Sure-Mix at 0.5% v/v (0.5 litre per 100 litres of spray solution).

Use the 0.5 litre per hectare rate of Assure II Herbicide when quackgrass and yellow foxtail are present in the field. The tank mix of Classic Herbicide and Assure II Herbicide may result in reduced control of these two grassy weeds

Consult the Assure II Herbicide label for specified rates and optimum leaf stage timing for grassy weeds. If leaf stages of the grass and broadleaf weeds do not coincide, a sequential application of the grass and broadleaf herbicides is required to ensure satisfactory control.

Consult the Assure II label for general information and use precautions.

NOTE TO USER: READ THE FOLLOWING BEFORE USING THIS PRODUCT FOR THE INDICATED SPECIAL USE APPLICATIONS:
FOR THE INDICATED SPECIAL USE APPLICATIONS:
The DIRECTIONS FOR USE for this product for the uses described below were developed by persons other than Production Agriscience Canada Company and accepted for registration by Health Canada under the User Requested Minor Use Label Expansion program. Production Agriscience Canada Company, itself makes no representation or warranty with respect to product performance (efficacy) and crop tolerance (phytotoxicity) claims for this product when used on the crops listed below.

Accordingly, the Buyer and User assume all risks related to performance and crop tolerance arising, and agree to hold Production Agriscience Canada Company harmless from any claims based on efficacy or phytotoxicity in connection with the uses described below.

SOYBEANS (Eastern Canada)
POSTEMERGENCE: Apply 36 g/ha Classic Herbicide + 0.2% v/v of a non-ionic surfactant + 2 L/ha liquid nitrogen fertilizer at 28% UAN for the suppression of wild carrot (Daucus carota) and volunteer adzuki beans (Vigna angularis Ohwi & Ohashi). Make only one application per year. Apply to soybeans in the 1-3 trifoliate stage of growth; apply to wild carrot when in the 2-20 leaf stage of growth and apply to volunteer adzuki beans when in the 1-3 trifoliate stage of growth.
Apply in a spray volume of 140-190 L water/ha.

Do not apply within 60 days of harvest.

Refer to other sections of this label for additional application instructions, soil limitations and/or use precautions. The addition of liquid fertilizer containing 28% nitrogen to the spray mixture at the rate of 2 L/ha is required for the suppression of volunteer adzuki beans and wild carrots and it may also improve control of velvetleaf.

**MIXING INSTRUCTIONS**

1. Fill clean tank about 1/4 full with fresh water.
2. Turn on full agitation.
3. Add the proper amount of Classic Herbicide to the water in the spray tank with the agitator running. Maintain full agitation until product is fully dispersed. Continuous agitation is required to keep the product in suspension.
4. After Classic Herbicide has been well mixed and is in suspension, add the tank mix partner, if applicable.
5. Add a recommended amount of spray adjuvant (if required).
6. Fill the remainder of the spray tank with clean water.

On repeat tank loads, ensure that the amount of spray solution left in the tank from the previous load is less than 10% of the volume about to be mixed.

Agitation is required for uniform mixing and application. The optimum water volume for Classic Herbicide application is 140-190 litres of water per hectare (minimum of 100 litres of water per hectare). Flat fan nozzles are recommended. Use 50 mesh filter screens or larger. Use spray preparation of Classic Herbicide within 24 hours or product degradation may occur resulting in a loss of weed control. Use vigorous agitation to thoroughly disperse spray mixtures that have been allowed to stand in the tank.

**NOTE:** Classic Herbicide will degrade in acidic or highly alkaline water. Mix no more than can be used in one day. If spraying is interrupted, thoroughly re-agitate the spray mixture before resuming spraying.

Do not mix or load where there is potential to contaminate wells or aquatic systems.

**SPRAYER CLEANUP**

To avoid subsequent injury to crops other than soybeans immediately after spraying and prior to spraying other crops, thoroughly remove all traces of Classic Herbicide from mixing and spray equipment as follows:

1. Drain tank; then flush tank, boom and hoses with clean water for a minimum of ten minutes. Visually inspect tank to assure removal of all visible residues of Classic Herbicide. If necessary, repeat step 1. **DO NOT CLEAN SPRAY EQUIPMENT NEAR WELLS, AQUATIC SYSTEMS, OR OTHER WATER SOURCES, OR NEAR DESIRABLE VEGETATION.**
2. Fill tank with clean water while adding 1 litre household ammonia (containing a minimum 3% ammonia) per 100 litres of water. Flush solution through boom and hoses, and then add more water to completely fill tank. Allow to sit for 15 minutes with agitation. Again flush the hoses, boom and nozzles with the cleaning solution and drain tank.
3. Remove the nozzles and screens and clean separately in a bucket containing cleaning agent and water.
4. Repeat Step 2.
5. Thoroughly rinse the tank with clean water for a minimum of 5 minutes, flushing water through the hoses and boom.
REPLANTING TO OTHER CROPS
Classic Herbicide is degraded by natural soil processes, and field tests have shown that the following crops may safely be planted at the prescribed interval following soybeans that have been treated with Classic Herbicide. The recropping intervals are dependent on the pH of the soil, as well as the sensitivity of the specific rotational crop.

* Warning: Sweet corn varieties may vary in their sensitivity to chlorimuron ethyl residues. Soil pH may vary significantly within a single field. It may be affected by soil amendments (i.e. lime, fertilizers, etc.) or soil conditions (i.e. eroded knolls, etc.).

For other crops, a field bioassay is recommended before planting. A successful field bioassay means growing to maturity a test strip of the crop(s) intended for production the following year.

FIELD BIOASSAY
Select a representative area or areas of the field previously treated with Classic Herbicide to plant your bioassay crop(s). Be sure to consider factors such as size of field, soil texture, drainage and turn-around areas when selecting the site(s) that are most representative of the soil conditions in the field. On large fields, more than one site may be needed in order to obtain reliable results.

Plant the test strips perpendicular to the direction in which the field was sprayed. The strips should be long enough to cross the width of several spray swathes. Large test strip areas are more reliable than small ones.

Use standard tillage and seeding equipment to plant the bioassay. Prepare a seed bed and plant the crops and varieties you want the option of growing the following year. It is important to use the same planting time, conditions, techniques and cultural practices you normally use to plant and grow the bioassay crop(s). Also plant into an adjacent area not treated with Classic Herbicide to use as a comparison.

As the crop(s) emerges and grows, examine these key points in Classic Herbicide treated and non-treated areas:
- crop stand
- root development
- rate of growth
- plant colour and vigour
- yield

Allow the bioassay crop(s) to grow to maturity while making your observations. Do not overspray the test strips with herbicides that may damage the bioassay crop(s). If the bioassay indicates that Classic Herbicide residues are still present, continue cropping only to those crops listed on the label and do not rotate to other crops until bioassay results indicate that susceptible crops are growing normally.

USE PRECAUTIONS
Do not apply Classic Herbicide during periods of intense rainfall or to soils saturated with water. Do not apply directly to standing or running water. Do not apply in areas where surface water from the treatment site can run off to adjacent cropland, either planted or to be planted, or into bodies of water (such as streams, ponds, rivers, lakes, and irrigation water), wetlands, or wells. Applications should only be made when there is no hazard of spray drift contaminating non-target land areas since very small quantities of the Classic
Herbicide spray solution may severely injure susceptible crops and other sensitive terrestrial habitats during both growing and dormant periods.

Do not apply to soybeans that have been stressed by severe weather conditions, frost, low fertility, drought, water saturated soil, disease or insect damage as crop injury may result.

Under extreme weather conditions, such as hot, dry weather, excessive moisture, or frost, weed control may be reduced.

Rainfall within 4 hours after application of Classic Herbicide may reduce weed control.

Because soybean varieties differ in their tolerance to herbicides, limit first use of Classic Herbicide to a small area of each variety prior to adoption as a field practice.

Overspray or drift to important aquatic and terrestrial wildlife habitats should be avoided. Leave a 16 metre buffer zone between the last spray swath and bodies of water such as ponds, lakes, rivers, and streams. Leave a 39 metre buffer zone between the last spray swath and wetlands, vegetated areas at the edges of bodies of water, woodlots and shelterbelts, and other terrestrial wildlife habitats.

Classic Herbicide must not be applied within 60 days of harvest.

Make only one application of Classic Herbicide per season.

Do not graze the treated crop or cut for hay; sufficient data is not available to support such use.

Do not apply Classic Herbicide to soybean grown on soil of pH \( \geq 8.0 \) due to risk of rotational crop injury.

**RESISTANCE-MANAGEMENT RECOMMENDATIONS**

For resistance management, Classic Herbicide is a Group 2 herbicide. Any weed population may contain or develop plants naturally resistant to Classic Herbicide and other Group 2 herbicides. The resistant biotypes may dominate the weed population if these herbicides are used repeatedly in the same field. Other resistance mechanisms that are not linked to site of action, but specific for individual chemicals, such as enhanced metabolism, may also exist. Appropriate resistance-management strategies should be followed.

To delay herbicide resistance:

*♦* Where possible, rotate the use of Classic Herbicide or other Group 2 herbicides within a growing season (sequence) or among growing seasons with different herbicide groups that control the same weeds in a field.

*♦* Use tank mixtures with herbicides from a different group when such use is permitted. To delay resistance, the less resistance-prone partner should control the target weed(s) as effectively as the more resistance-prone partner.

*♦* Herbicide use should be based on an integrated weed management program that includes scouting, historical information related to herbicide use and crop rotation, and considers tillage (or other mechanical control methods), cultural (for example, higher crop seeding rates; precision fertilizer application method and timing to favour the crop and not the weeds), biological (weed-competitive crops or varieties) and other management practices.

*♦* Monitor treated weed populations after herbicide application for signs of resistance development (for example, only one weed species on the herbicide label not controlled). If resistance is suspected, prevent weed seed production in the affected area if possible by an alternative herbicide from a different group. Prevent movement of resistant weed seeds to other fields by cleaning harvesting and tillage equipment when moving between fields, and planting clean seed.

*♦* Have suspected resistant weed seeds tested by a qualified laboratory to confirm resistance and identify alternative herbicide options.

*♦* Contact your local extension specialist or certified crop advisors for any additional pesticide resistance-management and/or integrated weed-management recommendations for specific crops and weed biotypes.
For further information or to report suspected resistance, contact your local Production Agriscience Canada Company representative or the Production Agriscience Canada Company hotline at 1-800-667-3852.

1.0 PRODUCT DESCRIPTION

Water soluble herbicide for non-selective weed control in CROPLAND SYSTEMS AND IN NON-CROPLAND AREAS.

CROPLAND USES INCLUDE
In cropping systems before planting of all crops; in minimum tillage systems; postemergent in Roundup Ready canola, soybeans and corn; preharvest applications in wheat, barley, oats, canola (rapeseed), flax (including low linolenic acid varieties), peas, lentils, dry beans, soybeans, chickpeas, dried lupins, dried fava beans and forages; in pasture renovation; in forage, legume and grass establishments; in tree crops including apple, pear, cherry, plum, peach, apricot, filbert, hazelnut, walnut, chestnut, Japanese heartnut; in grapes, cranberries, blueberries and strawberry; in sugar beets; in asparagus; in North American ginseng; in tree plantings; and grasses for seed production.

NON-CROPLAND USES INCLUDE
Industrial; recreational, rights-of-way, and public areas; turf grass renovation.

Not for relabelling or repackaging.

2.0 INFORMATION

For additional information on this or other Production Agriscience Canada Company products, call the Production Agriscience Canada Company hotline at 1-800-667-3852.

Read NOTICE before buying or using. If NOTICE terms are not acceptable, return at once unopened.

3.0 PRECAUTIONS

KEEP OUT OF REACH OF CHILDREN.
HARMFUL IF SWALLOWED.
HARMFUL IF INHALED.
CAUSES EYE AND SKIN IRRITATION.
Avoid contact with eyes, skin or clothing.
Avoid inhaling spray mist.

Wear a long-sleeved shirt and long pants during mixing, loading, application, clean-up and repair. In addition, wear goggles or a face shield and chemical-resistant gloves during mixing and loading, clean-up and repair.

Do not enter treated field within 12 hours of application.

3.1 FIRST AID

If swallowed: call a poison control centre or doctor immediately for treatment advice. Do not induce vomiting unless told to do so by a poison control centre or doctor. Do not give any liquid to the person. Do not give anything by mouth to an unconscious person.

If on skin or clothing: Take off contaminated clothing. Rinse skin immediately with plenty of water for 15–20 minutes. Call a poison control centre or doctor for treatment advice.

If inhaled: Move person to fresh air. If person is not breathing, call 911 or an ambulance, then give artificial respiration, preferably by mouth-to-mouth, if possible. Call a poison control centre or doctor for further treatment advice.
If in eyes: Hold eye open and rinse slowly and gently with water for 15–20 minutes. Remove contact lenses, if present, after the first 5 minutes, then continue rinsing eye. Call a poison control centre or doctor for treatment advice.

Take container, label or product name and Pest Control Product Registration Number with you when seeking medical attention.

3.2 **TOXICOLOGICAL INFORMATION**

Treat symptomatically. This product contains a petroleum distillate. Vomiting may cause aspiration pneumonia.

3.3 **ENVIRONMENTAL HAZARDS**

- **TOXIC** to aquatic organisms and non-target terrestrial plants. Observe buffer zones specified under DIRECTIONS FOR USE.
- To reduce runoff from treated areas into aquatic habitats, avoid application to areas with a moderate to steep slope, compacted soil or clay.
- Avoid application when heavy rain is forecast.
- Contamination of aquatic areas as a result of runoff may be reduced by including a vegetative strip between the treated area and the edge of the water body.

3.4 **PHYSICAL OR CHEMICAL HAZARDS**

Spray solutions of this product should be mixed, stored and applied only in stainless steel, aluminum, fiberglass, plastic and plastic-lined steel containers. **DO NOT MIX, STORE OR APPLY THIS PRODUCT OR SPRAY SOLUTIONS OF THIS PRODUCT IN GALVANIZED STEEL OR UNLINED STEEL (EXCEPT STAINLESS STEEL) CONTAINERS OR SPRAY TANKS.** This product or spray solutions of this product react with such containers and tanks to produce hydrogen gas which may form a highly combustible gas mixture. This gas mixture could flash or explode, causing serious personal injury, if ignited by open flame, spark, welder’s torch, lighted cigarette or other ignition source.

3.5 **STORAGE**

Avoid contamination of seed, feed, and foodstuffs. Soak up small amounts of spill with absorbent clays.

3.6 **DISPOSAL AND DECONTAMINATION**

**RECYCLABLE CONTAINERS**

Do not reuse this container for any purpose. This is a recyclable container, and is to be disposed of at a container collection site. Contact your local distributor/dealer or municipality for the location of the nearest collection site. Before taking the container to the collection site:

1. Triple- or pressure-rinse the empty container. Add the rinsings to the spray mixture in the tank.
2. Make the empty, rinsed container unsuitable for further use.

If there is no container collection site in your area, dispose of the container in accordance with provincial requirements.

**RETURNABLE CONTAINERS**

Do not reuse container for any other purpose. For disposal, this empty container may be returned to the point of purchase (distributor/dealer).
REFILLABLE CONTAINERS
For disposal, this container may be returned to the point of purchase (distributor/dealer). It must be refilled by the distributor/dealer with the same product. Do not reuse this container for any other purpose.

For information on the disposal of unused, unwanted product, contact the manufacturer and the provincial regulatory agency. Contact the manufacturer and the provincial regulatory agency in case of a spill, and for the clean-up of spills.

NOTICE TO USER: This pest control product is to be used only in accordance with the directions on the label. It is an offence under the Pest Control Products Act to use this product in a way that is inconsistent with the directions on the label. The user assumes the risk to persons or property that arises from any such use of this product.

DIRECTIONS FOR USE

4.0 GENERAL INFORMATION

Do not apply this product using aerial spray equipment except under conditions as specified within this booklet.

Glyphosate is not to be applied using hand-wicking or hand-daubing methods.

The restricted entry interval is 12 hours after application for all agricultural uses. Observe buffer zones specified in section 5.3.

Polaris™ MAX Herbicide, a water soluble liquid, mixes readily with water for application as a foliage spray for the control or destruction of most herbaceous plants. It may be applied through most standard industrial or field type sprayers after dilution and thorough mixing with water in accordance with the booklet instructions.

This herbicide moves through the plant from the point of foliage contact to and into the root system. Visible effects on most annual weeds occur within 2 to 4 days but on most perennial weeds may not occur until 7 to 10 days. Extremely cool or cloudy weather at treatment time may slow down activity of this product and delay visual effects of control. Visible effects are a gradual wilting and yellowing of the plant which advances to complete browning of above ground growth and deterioration of underground plant parts.

Delay application until vegetation has emerged to the stages described for control of such vegetation under the “Annual and Perennial Weed Control” (section 7.0 and 8.0) to provide adequate leaf surface to receive the spray. Unemerged plants arising from underground rhizomes or root stocks of perennials will not be affected by the spray and will continue to grow. For this reason, best control of most perennial weeds is obtained when treatment is made at late growth stages approaching maturity.

Always use the higher rate of this product per hectare within the recommended range when weed growth is heavy or dense, or weeds are growing in an undisturbed (non-cultivated) area.

Do not treat weeds under poor growing conditions such as drought stress, disease or insect damage, as reduced weed control may result. Reduced results may also occur when treating weeds heavily covered with dust.

This product does not provide residual weed control. For subsequent residual weed control follow a label approved herbicide program. Read and carefully observe the cautionary statements and all other information appearing on the labels of all herbicides used.
Rainfall occurring within 60 minutes of treatment may result in reduced weed control. Heavy rainfall immediately after application may wash the chemical off the foliage and a repeat treatment may be required. Do not apply if rainfall is forecast for the time of application.

Do not mix with any surfactant, pesticide, herbicide oils or any other material other than water unless specified in this booklet. For best results, spray coverage should be uniform and complete. Do not spray weed foliage to the point of run-off.

As this product is not registered for the control of pests in aquatic systems, DO NOT use to control aquatic pests

DO NOT contaminate irrigation or drinking water supplies or aquatic habitats by cleaning of equipment or disposal of wastes.

**RESISTANCE-MANAGEMENT RECOMMENDATIONS**

For resistance management, Polaris MAX Herbicide is a Group 9 herbicide. Any weed population may contain or develop plants naturally resistant to Polaris MAX Herbicide and other Group 9 herbicides. The resistant biotypes may dominate the weed population if these herbicides are used repeatedly in the same field. Other resistance mechanisms that are not linked to site of action, but specific for individual chemicals, such as enhanced metabolism, may also exist. Appropriate resistance-management strategies should be followed.

To delay herbicide resistance:

- Where possible, rotate the use of Polaris MAX Herbicide or other Group 9 herbicides within a growing season (sequence) or among growing seasons with different herbicide groups that control the same weeds in a field.
- Use tank mixtures with herbicides from a different group when such use is permitted. To delay resistance, the less resistance-prone partner should control the target weed(s) as effectively as the more resistance-prone partner.
- Herbicide use should be based on an integrated weed management program that includes scouting, historical information related to herbicide use and crop rotation, and considers tillage (or other mechanical control methods), cultural (for example, higher crop seeding rates; precision fertilizer application method and timing to favour the crop and not the weeds), biological (weed-competitive crops or varieties) and other management practices.
- Monitor weed populations after herbicide application for signs of resistance development (for example, only one weed species on the herbicide label not controlled). If resistance is suspected, prevent weed seed production in the affected area if possible by an alternative herbicide from a different group. Prevent movement of resistant weed seeds to other fields by cleaning harvesting and tillage equipment when moving between fields, and planting clean seed.
- Have suspected resistant weed seeds tested by a qualified laboratory to confirm resistance and identify alternative herbicide options.
- Contact your local extension specialist or certified crop advisors for any additional pesticide resistance-management and/or integrated weed-management recommendations for specific crops and weed biotypes.
- For further information or to report suspected resistance, contact Production Agriscience Canada Company hotline at 1-800-667-3852.

**5.0 MIXING AND APPLICATION**

**5.1 PRECAUTIONS**

**ATTENTION: AVOID CONTACT WITH FOLIAGE, GREEN STEMS, OR FRUIT OF CROPS, DESIRABLE PLANTS AND TREES SINCE SEVERE INJURY OR DESTRUCTION MAY RESULT.**
APPLY THESE SPRAY SOLUTIONS IN PROPERLY MAINTAINED AND CALIBRATED EQUIPMENT CAPABLE OF DELIVERING DESIRED VOLUMES.

DO NOT USE IN GREENHOUSES. REDUCED RESULTS MAY OCCUR IF WATER CONTAINING SOIL IS USED, SUCH AS WATER FROM PONDS AND UNLINED DITCHES.

Clean sprayers and parts immediately after using this product by thoroughly flushing with water. Do not contaminate water sources by disposal of wastes or cleaning of equipment.

DO NOT use human flaggers.

Apply only when the potential for drift to areas of human habitation or areas of human activity such as houses, cottages, schools and recreational areas is minimal. Take into consideration wind speed, wind direction, temperature, application equipment and sprayer settings.

NOTE: Use of this product in any manner not consistent with this booklet may result in injury to persons, animals or crops, or other unintended consequences. Keep container closed to prevent spills and contamination.

5.2 MIXING AND APPLICATION EQUIPMENT

MIXING WITH WATER
For ground or industrial type sprayers, fill the spray tank with one-half the required amount of water. Add the proper amount of herbicide, see “Weed Control” (sections 7.1 and 8.1) and mix well before adding the remaining portion of water. Placing the filling hose below the surface of the liquid solution will prevent excessive foaming. Removing hose from tank immediately will avoid back siphoning into water source. Use of mechanical agitators may cause excessive foaming. Bypass lines should terminate at the bottom of the tank.

For use in knapsack sprayers, it is suggested that the proper amount of this herbicide be mixed with water in a larger container. Fill sprayer with the mixed solution.

TANK MIXING PROCEDURE
The following steps should be followed when adding tank mix partners, using an herbicide loading system or adding product directly into the tank:

1. Fill spray tank 3/4 full of water.
2. Start agitation and run for entire mixing and spraying operation.
3. Add required amount of the tank mix partner.
4. Flush herbicide loading tank and herbicide containers with water.
5. If using an herbicide loading system - ensure that the loading tank and lines to the pump are empty and flushed out with water before adding tank mix partner.
6. Add required amount of Polaris MAX Herbicide.
7. Flush herbicide loading tank and herbicide containers with water.
8. If using an herbicide loading system - ensure that the loading tank and lines to the pump are flushed with water and empty before starting spray operation.

Always start and end the mixing and spraying operation with a clean system.
APPLICATION EQUIPMENT

BOOM EQUIPMENT
For control of perennial weeds and woody brush and trees listed on this booklet using conventional boom equipment – apply this product in 50 to 300 litres of clean water per hectare as a broadcast spray using no more than 275 kPa pressure. See “Weed Control” (sections 7.1 and 8.1) for rates to control specific weeds.

For control of annual weeds listed on this booklet using conventional boom equipment – apply this product in 50 to 100 litres of clean water per hectare as a broadcast spray, except as otherwise stated on this label using no more than 275 kPa pressure. See “Weed Control” (sections 7.1 and 8.1) for rates to control specific weeds.

HAND HELD AND HIGH VOLUME EQUIPMENT
(use coarse sprays only)

For control of weeds and woody brush and trees listed in the “Weed Control” section (6.0) of this label using knapsack sprayers or high volume spraying equipment utilizing handguns or other suitable nozzle arrangements – Unless otherwise specified, make a 0.67 percent solution of this product in water (0.67 litres of this product in 100 litres of water) and apply to foliage of vegetation to be controlled. For best results, use a 1.34 percent solution (1.34 litres of this product in 100 litres of water) on harder to control perennials such as field bindweed, hemp dogbane, milkweed and Canada thistle.

Applications should be made on a spray-to-wet basis. Spray coverage should be uniform and complete. Do not spray to point of run-off. Handgun applications should be properly directed to avoid spraying desirable plants.

SELECTIVE EQUIPMENT
Selective equipment such as WIPER and ROLLER applicators can be used for weed control in soy and dry beans, orchards, vineyards, cranberries, strawberries and non-crop areas. For information regarding use of this product with selective equipment, refer to “Selective Equipment” (section 9.12).

AERIAL EQUIPMENT
Aerial application can only be used for weed control in preharvest situations. Refer to sections 5.3 and 9.9.2 for application information.

Directions for use
Apply only by fixed-wing or rotary aircraft which has been functionally and operationally calibrated for the atmospheric conditions of the area and the application rates and conditions of this label. Ensure that the maximum boom width does not exceed 65% of the wing span. Nozzle type, size and orientation must be configured to deliver a droplet size VMD in the coarse (400-600 microns) or very coarse (600-1000) range.

Label rates, conditions and precautions are product specific. Read and understand the entire label before opening this product. Apply only at the rate(s) recommended for aerial application on this label. Where no rate for aerial application appears for the specific use, this product cannot be applied by any type of aerial equipment.

Ensure uniform application. To avoid streaked, uneven or overlapped application, use appropriate marking devices, or equivalent electronic positioning systems (GPS). The use of spotter planes is recommended.
Thoroughly wash aircraft, especially landing gear, after each day of spraying to remove residues of this product accumulated during spraying or from spills. **PROLONGED EXPOSURE OF THIS PRODUCT TO UNCOATED STEEL SURFACES MAY RESULT IN CORROSION AND POSSIBLE FAILURE OF THE PART. LANDING GEAR IS MOST SUSCEPTIBLE.** The maintenance of an organic coating (paint) which meets aerospace specification MIL-C-38412 may prevent corrosion.

**Use Precautions**

Apply only when meteorological conditions at the treatment site allow for complete and even crop coverage. Apply only under conditions of good practice specific to aerial application as outlined in the National Aerial Pesticide Application Manual, developed by the Federal/Provincial/Territorial Committee on Pest Management and Pesticides.

Do not apply to any body of water. Avoid drifting of spray onto any body of water or other non-target areas. Specified buffer zones should be observed.

Coarse sprays are less likely to drift, therefore, avoid combinations of pressure and nozzle type that will result in fine particles (mist). Do not apply during periods of dead calm or when wind velocity and direction pose a risk of spray drift. Do not spray when the wind is blowing towards a nearby sensitive crop, garden, terrestrial habitat (such as shelter-belt) or aquatic habitat.

Do not angle nozzles forward into the airstream and do not increase spray volume by increasing nozzle pressure.

Applies only when the potential for drift to areas of human habitation or areas of human activity such as houses, cottages, schools and recreational areas is minimal. Take into consideration wind speed, wind direction, temperature inversions, application equipment and sprayer settings.

**Operator Precautions**

Do not allow the pilot to mix chemicals to be loaded onto the aircraft. Loading of premixed chemicals with a closed system is permitted.

It is desirable that the pilot have communication capabilities at each treatment site at the time of application.

The field crew and the mixer/loaders must wear chemical resistant gloves, coveralls and goggles or face shield during mixing/loading, cleanup and repair. Follow the more stringent label precautions in cases where the operator precautions exceed generic label recommendations on the existing ground boom label.

All personnel on the job site must wash hands and face thoroughly before eating and drinking. Protective clothing, aircraft cockpit and vehicle cabs must be decontaminated regularly.

**Product Specific Precautions**

Read and understand the entire label before opening this product. If you have questions, call the Production Agriscience Canada Company hotline at 1-800-667-3852 or obtain technical advice from the distributor or your provincial agricultural representative.

Application of this product must meet and/or conform to the following:

Volume: Apply the recommended rate in a minimum spray volume of 30-100 litres per hectare.
5.3 BUFFER ZONES

Field sprayer application: DO NOT apply during periods of dead calm. Avoid application of this product when winds are gusty. DO NOT apply with spray droplets smaller than the American Society of Agricultural Engineers (ASAE S572.1) coarse classification. Boom height must be 60 cm or less above the crop or ground.

Airblast or mist blower application: DO NOT apply during periods of dead calm. Avoid application of this product when winds are gusty. DO NOT direct spray above plants to be treated. DO NOT apply when wind speed is greater than 16 km/h at the application site as measured outside of the treatment area on the upwind side. For airblast applications, turn off outward pointing nozzles at row ends and outer rows.

Aerial application: DO NOT apply during periods of dead calm. Avoid application of this product when winds are gusty. DO NOT apply when wind speed is greater than 16 km/h at flying height at the site of application. DO NOT apply with spray droplets smaller than the American Society of Agricultural Engineers (ASAE S572.1) coarse classification. To reduce drift caused by turbulent wingtip vortices, the nozzle distribution along the spray boom length MUST NOT exceed 65% of the wing- or rotorspan.

BUFFER ZONES

Use of the following spray methods or equipment DO NOT require a buffer zone: hand-held or backpack sprayer and spot treatment, inter-row hooded sprayer, low-clearance hooded or shielded sprayers that ensure spray drift does not come in contact with orchard crop fruit or foliage, soil drench and soil incorporation.

For application to rights-of-way and for forestry uses, buffer zones for protection of sensitive terrestrial habitats are not required; however, the best available application strategies which minimize off-site drift, including meteorological conditions (for example, wind direction, low wind speed) and spray equipment (for example, coarse droplet sizes, minimizing height above canopy), should be used. Applicators must, however, observe the specified buffer zones for protection of sensitive aquatic habitats.

The buffer zones specified in the table below are required between the point of direct application and the closest downwind edge of sensitive terrestrial habitats (such as grasslands, forested areas, shelter belts, woodlots, hedgerows, riparian areas and shrublands) and sensitive aquatic habitats (such as lakes, rivers, sloughs, ponds, prairie potholes, creeks, marshes, streams, reservoirs, wetlands and estuarine/marine water bodies).

Buffer Zones for the Protection of Aquatic and Terrestrial Habitats from Spray Drift of Glyphosate Products without POEA

### Non-cropland system and aerial application method

| Non-crop land and industrial uses: rights-of-way areas only | Fixed wing | 3 | 100 | NR |
| | Rotary wing | 3 | 60 | NR |
* Buffer zones for the protection of terrestrial habitats are not required for use on rights-of-way including railroad ballast, rail and hydro rights-of-way, utility easements, roads, and training grounds and firing ranges on military bases.

NR = Not Required
For tank mixes, consult the labels of the tank-mix partners and observe the largest (most restrictive) buffer zone of the products involved in the tank mixture and apply using the coarsest spray (ASAE) category indicated on the labels for those tank mix partners.
The buffer zones for this product can be modified based on weather conditions and spray equipment configuration by accessing the Buffer Zone Calculator on the Pest Management Regulatory Agency web site.

6.0 WEEDS CONTROLLED

This product controls many annual and perennial grasses, broadleaf weeds, and woody brush and trees when applied as recommended and under conditions described. For information on how to control specific weeds including herbicide rate, refer to “Annual Weed Control” and “Perennial Weed Control” (sections 7.1 and 8.1). The following is a partial list of weeds controlled:

6.1 ANNUAL WEEDS

ANNUAL GRASSES

| Barnyard Grass | Echinochloa crusgalli |
| Blue Grass (annual) | Poa annua |
| Crab Grass (large) | Digitaria sanguinalis |
| Crab Grass (smooth) | Digitaria ischaemum |
| Downy Brome Grass | Bromus tectorum |
| Fall Panicum | Panicum dichotomiflorum |
| Giant Foxtail | Setaria faberii |
| Green Foxtail | Setaria viridis |
| Persian Darnel | Lolium persicum |
| Volunteer Barley | Hordeum spp. |
| Volunteer Corn | Zea mays |
| Volunteer Wheat | Triticum spp. |
| Wild Oats | Avena fatua |
| Wild Proso Millet | Panicum miliaceum |
| Yellow Foxtail | Setaria glauca |
| OTHER |
| Dodder | Cuscuta spp. |

ANNUAL BROADLEAF WEEDS

| Chickweed | Stellaria media |
| Cleavers | Galium aparine |
| Cocklebur | Xanthium strumarium |
| Corn Spurry | Spergula arvensis |
| Cow Cockle | Saponaria vaccaria |
| Eastern Black Nightshade | Solanum ptycanthum |
| Fleabane (Canada) | Erigeron canadensis |
| Flixweed | Descurainia sophia |
Green Smartweed  
*Polygonum scabrum*

Hempnettle  
*Galeopsis tetrahit*

Kochia  
*Kochia scoparia*

Lady’s-Thumb  
*Polygonum persicaria*

Lamb’s-quarters (common)  
*Chenopodium album*

Narrow-leaved Hawk’s Beard  
*Crepis tectorum*

Narrow-leaved Vetch  
*Vicia angustifolia*

Night-flowering Catchfly  
*Silene noctiflora*

Pennsylvania Smartweed  
*Polygonum pensylvanicum*

Prickly Lettuce  
*Lactuca scariola*

Ragweed (common)  
*Ambrosia artemisiifolia*

Redroot Pigweed  
*Amaranthus retroflexus*

Round-Leaved Mallow  
*Malva pusilla*

6.2 PERENNIAL WEEDS

PERENNIAL GRASSES/SEDGES

Blue Grass (Canada)  
*Poa compressa*

Blue Grass (Kentucky)  
*Poa pratensis*

Brome Grass (smooth)  
*Bromus inermis*

Cattail (common)  
*Typha latifolia*

Cottongrass  
*Eriophorum chamissonis*

Foxtail Barley  
*Hordeum jubatum*

Quackgrass  
*Elytrigia repens*

Wire-Stemmed Muhly  
*Muhlenbergia frondosa*

Yellow Nutsedge  
*Cyperus esculentus*

Russian Thistle  
*Salsola pestifer*

Shepherd’s Purse  
*Capsella bursa-pastoris*

Smooth Pigweed  
*Amaranthus hybridus*

Sowthistle (annual)  
*Sonchus oleraceus*

Stinkweed  
*Thlaspi arvense*

Storksbill  
*Erodium cicutarium*

Velvetleaf  
*Abutilon theophrasti*

Volunteer Canola (rapeseed)  
*Brassica spp.*

Volunteer Flax  
*Linum spp.*

Wild Buckwheat  
*Polygonum convolvulus*

Wild Mustard  
*Sinapis arvensis*

Wild Tomato  
*Solanum triflorum*
PERENNIAL BROADLEAVED WEEDS

Alfalfa  
Medicago spp.

Curled Dock  
Rumex crispus

Dandelion  
Taraxacum officinale

Field Bindweed  
Convolvulus arvensis

Hemp Dogbane  
Apocynum cannabinum

Hoary Cress  
Cardaria draba

Knotweed (Japanese)  
Polygonum cuspidatum

Milkweed (common)  
Asclepias syriaca

Poison Ivy  
Rhus radicans

Purple Loosestrife  
Lythrum salicaria

Sow Thistle (perennial)  
Sonchus arvensis

Thistle (Canada)  
Cirsium arvense

Toad Flax  
Linaria vulgaris

Wormwood (Absinth)  
Artemisia absinthium

6.3 WOODY BRUSH AND TREES

Alder  
Alnus spp.

Birch  
Betula spp.

Broadleaved meadowsweet  
Spiraea latifolia

Rhododendron (Canadian)  
Rhododendron canadense

Cedar  
Thuja spp.

Cherry  
Prunus spp.

Douglas Fir  
Pseudotsuga spp.

Hemlock  
Tsuga spp.

Maple  
Acer spp.

Mountain-fly honeysuckle  
Lonicera villosa

Pine  
Pinus spp.
Poplar  
*Populus spp.*
Raspberry/Salmonberry  
*Rubus spp.*
Sheep laurel  
*Kalmia angustifolia*
Snowberry (Western)  
*Symphoricarpos occidentalis*
Sweet fern  
*Comptonia peregrina*
Willow  
*Salix spp.*
Withrod  
*Viburnum cassinoides*

### 7.0 ANNUAL WEED CONTROL

The following tables provide rates and specific application instructions for control of the annual weeds listed.

#### 7.1 ANNUAL WEED CONTROL WITH POLARIS MAX HERBICIDE

**DO NOT APPLY BY AIR.**

<table>
<thead>
<tr>
<th>RATE (L/ha)</th>
<th>GROWTH STAGE</th>
<th>WEEDS CONTROLLED</th>
<th>COMMENTS</th>
</tr>
</thead>
</table>
| **0.5**     | Weeds up to 8 cm in height | Wild oats, green foxtail, volunteer barley, volunteer wheat  
Non-Roundup Ready volunteer canola (rapeseed), wild mustard, lady's-thumb, stinkweed | • For wild oats apply at 1-3 leaf stage.  
• Add 350 mL of a surfactant registered for use such as Agral 90, Ag Surf, or Companion  
• For heavy wild oat infestations use 0.67 L/ha rate. |
| **0.67**    | Weeds 8 cm to 15 cm in height | All annual grasses listed above.  
All annual broadleaved weeds listed above plus flixweed* and kochia* | • Add 350 mL of surfactant registered for use as listed above.  
* Suppression only.  Refer to higher rates of this table or tank mix table (section 7.2) for control options. |
| **0.83 – 1.27** | Weeds up to 15 cm in height | All annual grasses listed above plus downy brome, giant foxtail, and Persian darnel.  
All annual broadleaved weeds listed above plus cleavers, lamb's-quarters, redroot pigweed, hempnettle, flixweed, Russian thistle, volunteer flax, common ragweed*, Canada fleabane*, wild buckwheat**, narrow-leaved hawk's beard*** | • No surfactant required.  
• For tank mix weed control options see section 7.2.  
* DO NOT use these rates on plants greater than 8 cm in height.  
** For 3-4 leaf stage use 1.27 L/ha rate.  
*** For weeds 8 cm to 15 cm in height use 1.27 L/ha rate. |
1.5 Weeds up to 15 cm in height

All annual grasses listed above plus crab grass and annual blue grass

All annual broadleaved weeds listed above plus kochia, prickly lettuce, shepherd’s purse, annual sow thistle, and narrow-leaved vetch

• For additional annual broadleaved weed control options, refer to tank mix table (section 7.2).

2.33 Weeds over 15 cm in height

All annual grasses and broadleaved weeds listed above

• For additional annual broadleaved weed control options, refer to tank mix table (section 7.2).

NOTE: For spot treatment, 0.5 – 2.33 litres per hectare is approximately equivalent to 5 – 23 mL/100m², respectively.

7.2 ANNUAL WEED CONTROL WITH POLARIS MAX HERBICIDE TANK MIXTURES FOR SUMMERFALLOW & MINIMUM TILLAGE SYSTEMS

<table>

</tbody>
</table>

This tank mix is registered for summerfallow use only. Weeds should be less than 15 cm tall and actively growing for best results.

Use higher rate if weeds are beyond 8 cm in height.

* Polaris MAX Herbicide applied at 0.67 L/ha rate only.

** Suppression only. See other tank mixtures for control options.

Add 350 mL/ha of surfactant – see list in section 7.3.

Use this tank mix prior to seeding in wheat, barley, rye, oats, field corn only (do not apply to sweet corn).

Certain broadleaved crops such as lentils, peas, canola and flax can be injured by a pre-seeding application and so should not be planted to a field receiving this treatment.

Annual grasses - apply any time between emergence and heading.

Weeds should be less than 15 cm tall and actively growing for best results.

Refer to Express Toss-N-Go label for the appropriate weed growth stage. Add 350 mL/ha of surfactant – see list in section 7.3. |

♦ For foxtail barley, refer to “Perennial Weed Control” table (section 8.1).
^ 0.56 kg ai/ha of 2,4-D. ^A Adjust rates accordingly for other 2,4-D formulations. Use only low volatile ester or amine formulations of 2,4-D.
^C Use only amine formulations of MCPA prior to seeding in corn and field peas.

7.3 SURFACTANT INFORMATION

NOTE:
Addition of Surfactant – Polaris MAX Herbicide tank mixtures for annual weed control may require the addition of a surfactant registered for use such as Agral 90, Ag-Surf or Companion. Refer to Section 7.2 for recommendations. Surfactant should be added at a rate of 350 millilitres per hectare, in 50 - 100 litres of clean water.

7.4 ADDITIONAL IMPORTANT INFORMATION FOR ANNUAL WEED CONTROL

Polaris MAX Herbicide applied alone will not control volunteers from crops containing the Roundup Ready gene.

Allow at least 1 day after treatment before tillage.

Annual weeds generally will continue to germinate from seed throughout the growing season. Repeat treatments may be necessary to control later germinating weeds, in some situations.

For additional information and precautions, refer to “General Information” and “Mixing and Application” (Sections 4.0 and 5.0, respectively).

7.5 WEED CONTROL IN TRUFLEX ROUNDUP READY CANOLA VARIETIES

WARNING: APPLY POLARIS MAX HERBICIDE TO TRUFLEX ROUNDUP READY CANOLA VARIETIES ONLY.

NOTE: ALWAYS USE PEDIGREED (I.E., CERTIFIED) TRUFLEX ROUNDUP READY CANOLA SEED. CANOLA NOT DESIGNATED AS TRUFLEX ROUNDUP READY WILL BE DAMAGED OR DESTROYED BY THIS TREATMENT.

- For additional information and precautions refer to “General Information” and “Mixing and Application” (sections 4.0 and 5.0, respectively).
- Apply to TruFlex Roundup Ready canola only as directed.
DO NOT APPLY BY AIR

The following table describes the rate and specific application instructions for weed control in TruFlex Roundup Ready canola varieties.

</tr>
</tbody>
</table>

* First flower is when 50% of the plants in the field have no more than one flower.

Ensure the crop has not advanced beyond the recommended growth stage for all applications.

**Guidelines**
Repeat applications may be required if a second flush of weeds germinates prior to canopy closure.

Maximum 3.33L/ha is allowed for the postemergence use.

### 7.5.1 TRUFLEX ROUNDPUP READY HYBRID CANOLA SEED PRODUCTION

**For Use only in Trueflex Roundup Ready Canola Seed Production Systems**
Apply using ground boom spray equipment.

Polaris MAX Herbicide may be applied for the control of non-glyphosate tolerant canola pollen parental line(s) in hybrid canola seed production fields containing both TruFlex Roundup Ready line(s) and non-TruFlex Roundup Ready line(s).
When pollination is complete or near completion, non-TruFlex Roundup Ready pollen parental line(s) may be controlled with an application of 0.83 to 1.67 litres per hectare of Polaris MAX Herbicide applied in 50 to 200 litres per hectare water.

Sequential applications (Maximum 2 applications) may be used for the control of pollen parental line(s) but the total Maximum rate applied must not exceed 1.67 litres per hectare. Allow at least 5 days between sequential applications.

### 7.6 WEED CONTROL IN ROUNDUP READY CANOLA VARIETIES

**WARNING:** APPLY POLARIS MAX HERBICIDE ON ROUNDUP READY CANOLA VARIETIES ONLY.

**NOTE:** ALWAYS USE PEDIGREED (I.E., CERTIFIED) ROUNDUP READY CANOLA SEED. CANOLA WHICH IS NOT DESIGNATED AS ROUNDUP READY WILL BE DAMAGED OR DESTROYED BY THIS TREATMENT.

- For additional information and precautions refer to “General Information” and “Mixing and Application” (sections 4.0 and 5.0, respectively).
- Apply Polaris MAX Herbicide in Roundup Ready canola only as directed in the following weed control table.
- Some short-term, visual yellowing may occur when Polaris MAX Herbicide is applied at the late application (4 to 6 leaf stage) of the crop. This effect is temporary and will not influence crop growth, maturity or yield.

**DO NOT APPLY BY AIR.**

The following table describes the rate and specific application instructions for control of annual and perennial weeds in Roundup Ready canola varieties.

#### WEED CONTROL IN ROUNDUP READY CANOLA VARIETIES

<table>
<thead>
<tr>
<th>RATE (L/ha)</th>
<th>GROWTH STAGE OF CROP</th>
<th>WEEDS CONTROLLED</th>
<th>COMMENTS</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.55 – 1.27</td>
<td>0 to 6 leaf</td>
<td><strong>Annual Grasses</strong> Wild oats, green foxtail, volunteer barley, volunteer wheat, barnyard grass</td>
<td>Repeat applications may be required if a second flush of weeds germinates prior to canopy closure. Ensure the crop has not advanced beyond the recommended growth stage. <strong>Use the 0.83 L/ha rate for control of these weeds at all crop growth stages.</strong> The lower rate can be used for control of shepherd’s purse, cow cockle and night-flowering catchfly at the 1– to 3-leaf stage of the crop or for control of smartweed at the 4– to 6-leaf stage. <strong>A single application of 0.83 L/ha is required.</strong></td>

<td><strong>A single application of 0.83 L/ha is required.</strong></td>
</tr>
</tbody>
</table>
### Perennials (suppression)**
- Canada thistle
- Perennial sow thistle
- Dandelion

### Perennials (season-long control)
- Quackgrass
- Foxtail barley
- Canada thistle
- Perennial sow thistle

*** Sequential applications of 0.83 L/ha are required.

**** Sequential applications of 0.83 L/ha are required or a single application of 1.27 L/ha.

For sequential applications, ensure the crop has not advanced beyond the recommended growth stage.

Maximum 1.66 L/ha is allowed for the postemergence use.

### 7.6.1 TANK MIXTURES

For season long control of top growth of Canada thistle and control of wild buckwheat in Roundup Ready canola varieties, apply a tank mixture of 0.28 L/ha of Lontrel 360 with 0.83 L/ha of Polaris MAX Herbicide, in 100 litres of water per hectare. Apply when canola is in the 2- to 6-leaf stage. Refer to the Lontrel 360 and to the Polaris MAX Herbicide labels for a list of other weeds controlled, timing of application, water volumes and use precautions.

### 7.6.2 ROUNDUP READY HYBRID CANOLA SEED PRODUCTION

For Use only in Roundup Ready Hybrid Canola Seed Production Systems

Apply using ground boom spray equipment.

Polaris MAX Herbicide may be applied for the control of non-Roundup Ready canola pollen parental line(s) in hybrid canola seed production fields containing both Roundup Ready line(s) and non-Roundup Ready line(s).

When pollination is complete or near completion, non-Roundup Ready pollen parental line(s) may be controlled with an application of 0.83 to 1.67 litres per hectare of Polaris MAX Herbicide applied in 50 to 200 litres per hectare water.

Sequential applications (Maximum 2 applications) may be used for the control of pollen parental line(s) but the total Maximum rate applied must not exceed 1.67 litres per hectare. Allow at least 5 days between sequential applications.

### 7.7 WEED CONTROL IN ROUNDUP READY OR ROUNDUP READY2 YIELD SOYBEAN VARIETIES

### 7.7.1 WEED CONTROL IN ROUNDUP READY2 YIELD SOYBEAN VARIETIES

**WARNING:** APPLY POLARIS MAX HERBICIDE ON ROUNDUP READY2 YIELD SOYBEAN VARIETIES ONLY.

**NOTE:** ROUNDUP READY 2 YIELD SOYBEAN VARIETIES ARE TOLERANT OF GLYPHOSATE, THE ACTIVE INGREDIENT IN POLARIS MAX HERBICIDE. ALWAYS USE PEDIGREED (I.E., CERTIFIED) SOYBEAN SEED DESIGNATED AS ROUNDUP READY2 YIELD. SOYBEANS WHICH ARE NOT DESIGNATED AS ROUNDUP READY2 YIELD WILL BE DAMAGED OR DESTROYED BY THIS TREATMENT.
DO NOT APPLY BY AIR.

<table>

<td>---------------------------------------------</td>
</tr>
<tr>
<td>3.33</td>
<td>First trifoliate leaf stage through flowering</td>
<td>All weeds listed above plus horse-nettle and tall waterhemp⁶</td>
<td>Only one application per season at 3.33 L/ha. Common milkweed should be 15-60 cm in height and actively growing. Yellow nutsedge should be 5-15 cm in height and actively growing. Plants not fully emerged at the time of application will escape treatment.⁶ For season-long control of horse-nettle (<em>Solanum carolinense</em>) (2- to 12-leaf stage) or, for control of tall waterhemp (<em>Amaranthus tuberculatus</em>) (up to and including the 18-leaf stage) apply 3.33 L/ha. Alternatively, sequential applications of 1.67 L/ha followed by 1.67 L/ha may be applied. Applications should be at least 2 weeks apart for best results.⁶ For the control of Tall Waterhemp use the higher rate if weeds are beyond the 6-leaf stage.</td>
</tr>
<tr>
<td>4.67</td>
<td>First trifoliate leaf stage through flowering</td>
<td>All weeds listed above plus control of volunteer alfalfa and bromegrass</td>
<td>Only one application per season at 4.67 L/ha. Alfalfa should have 9 or more leaves and be at least 10-15 cm tall. Bromegrass should have at least 3-5 leaves and be at least 10-15 cm tall. Short term yellowing may occur in sprayer overlap areas with the 4.67 L/ha application rate. This effect is temporary and will not influence crop growth or yield.</td>
</tr>
</tbody>
</table>

♦ Weeds will be more easily controlled and early crop competition avoided with applications made when the weeds are small. Control of annual weeds greater than 25 cm in height will be inconsistent, although some weeds may be controlled.
7.7.2 WEED CONTROL IN ROUNDUP READY SOYBEAN VARIETIES

WARNING: APPLY POLARIS MAX HERBICIDE ON ROUNDUP READY SOYBEAN VARIETIES ONLY.

NOTE: ALWAYS USE PEDIGREED (I.E., CERTIFIED) SOYBEAN SEED DESIGNATED AS ROUNDUP READY. SOYBEANS WHICH ARE NOT DESIGNATED AS ROUNDUP READY WILL BE DAMAGED OR DESTROYED BY THIS TREATMENT.

DO NOT APPLY BY AIR.

Apply 1.67 – 3.33 L/ha of Polaris MAX Herbicide to Roundup Ready soybean varieties.

See Section 7.6.1 for use directions.

Do not apply the 4.67 L/ha rate to non-Roundup Ready2 Yield soybean varieties.

7.7.3 TANK MIXTURES

Tank mixtures may be applied to both Roundup Ready2 Yield and Roundup Ready soybean varieties.

**Polaris MAX Herbicide Plus Pursuit Herbicide**

For added residual control of late germinating eastern black nightshade, common lamb’s quarters, redroot pigweed, velvetleaf, fall panicum and wild proso millet, Pursuit herbicide may be tank mixed with Polaris MAX Herbicide at a rate of 1.67 liters per hectare. Use 0.16 to 0.21 liters per hectare of Pursuit and apply up to and including the 3rd trifoliate leaf stage of the Roundup Ready soybeans in 100-200 liters per hectare of clean water. The higher rate is recommended for heavier infestations. This tank mix is recommended primarily for soybean systems with row spacings of 50 centimeters (20 inches) or more where a single application timing is desired.

Mixing: Add and mix Pursuit as per instructions on the Pursuit label and then add Polaris MAX Herbicide as per instructions on this label.

A PHI of 100 days is required for the tank mix of Polaris MAX Herbicide and Pursuit herbicide on Roundup Ready2 yield soybeans.

Only one application per season of Polaris MAX Herbicide at 1.67 liters per hectare tank mixed with Pursuit herbicide at 0.16 to 0.21 liters per hectare is permitted.

Refer to the Pursuit herbicide label for further safety precautions and handling instructions.

**Polaris MAX Herbicide Plus FirstRate Herbicide (For Use in Eastern Canada Only)**

For added residual control of common ragweed, velvetleaf, cocklebur, jimsonweed and giant ragweed, FirstRate Herbicide may be tank mixed with Polaris MAX Herbicide at a rate of 0.83 - 1.67 liters per hectare. Use 20.8 grams per hectare of FirstRate Herbicide.

Do not harvest soybean plants for forage or hay. Do not harvest soybeans for 65 days after application.

Only one application per season of Polaris MAX Herbicide tank mixed with FirstRate Herbicide is permitted.

Refer to the FirstRate Herbicide label for further safety precautions and handling instructions.
**Polaris MAX Herbicide and Classic 25 DF Herbicide**

For season-long control of dandelion, annual sow thistle, and yellow nutsedge*, apply Classic 25 DF Herbicide at 36 grams per hectare plus Polaris MAX Herbicide at 1.67 litres per hectare. Add a non-ionic surfactant such as Agral 90, Citowett Plus, or Ag-Surf at 0.2% v/v. Apply when soybeans are in the 1-3 trifoliate stage; dandelions and annual sow thistle less than 15 cm tall and across; and up to the 8 leaf stage for yellow nutsedge. USE THIS TANK MIXTURE ONLY ON SOYBEANS WITH THE ROUNDCUP READY TRAIT.

Consult the Classic 25 DF Herbicide label for tank mixing instructions and use precautions including instructions on replanting to other crops.

*Use this tank mix only in cases of heavy infestation of yellow nutsedge.

**Polaris MAX Herbicide plus Sencor 75 DF Herbicide for Control of Spreading Atriplex (Eastern Canada only)**

For the control of spreading atriplex, apply a preplant application of Sencor 75 DF Herbicide at 0.75 - 1.11 kg product per hectare on medium textured soils or 1.11 – 1.5 kg product per hectare on fine textured soils plus Polaris MAX Herbicide at 1.67 litres per hectare. Do not apply on coarse textured soils. Apply when spreading atriplex is up to the 10-leaf stage of growth. Only one application per year is permitted.

Refer to the Sencor 75 DF Herbicide label for further use directions, safety precautions and handling instructions. Consult Table entitled “Sencor 75 DF Alone: Preemergence Application” for specific rates based on soil types and organic matter.

<td>1.67 – 3.33 L/ha Polaris MAX Herbicide + 0.25 - 0.38 L/ha Assure II Herbicide</td>
<td>First trifoliate leaf stage through flowering.</td>
<td>Volunteer Roundup Ready corn. Apply at the 2- to 6-leaf stage of the weed.</td>
<td>See additional information following this table.</td>
</tr>
</tbody>
</table>

*Sure Mix may or may not be added to this tank mix

♦ Weeds will be more easily controlled and early crop competition avoided with applications made when the weeds are small. Control of annual weeds greater than 25 centimetres in height will be inconsistent, although some weeds may be controlled.

**Volunteer Roundup Ready Corn Control**

For control of volunteer Roundup Ready corn, Assure II herbicide may be tank mixed with Polaris MAX Herbicide. Use 1.67 to 3.33 litres per hectare Polaris MAX Herbicide and 0.25 - 0.38 litre per hectare of Assure II herbicide.

The higher rate of Assure II may be required when there are high populations of volunteer Roundup Ready corn, other grass weeds are present or when conditions at application are not favorable for weed growth.

Apply in 100 to 300 litres per hectare of clean water.

**Mixing:** Add and mix Assure II herbicide as per instructions on the Assure II herbicide label and then add Polaris MAX Herbicide as per instructions on this label.
This tank mix is to be applied when the crop is from the first trifoliate leaf stage through flowering and when the volunteer Roundup Ready corn is at the 2- to 6-leaf stage.

A PHI (preharvest interval) of 80 days is required for the tank-mix of Polaris MAX Herbicide and Assure II herbicide on Roundup Ready2 Yield soybeans.

Refer to the Assure II Herbicide label for further safety precautions and handling instructions.

**POLARIS MAX HERBICIDE PLUS VENTURE L HERBICIDE**

</table>

* Turbocharge may or may not be added to this tank mix

* Weeds will be more easily controlled and early crop competition avoided with applications made when the weeds are small. Control of annual weeds greater than 25 centimetres in height will be inconsistent, although some weeds may be controlled.

For control of volunteer Roundup Ready corn, Venture L Herbicide may be tank mixed with Polaris MAX Herbicide. Use 1.67 to 3.33 litres per hectare Polaris MAX Herbicide and 0.45 - 0.60 litre per hectare of Venture L Herbicide.

The higher rate of Venture L Herbicide may be required when there are high populations of volunteer Roundup Ready corn, other grass weeds are present or when conditions at application are not favorable for weed growth.

Apply in 100 to 200 litres per hectare of clean water.

**Mixing:** Add and mix Venture L Herbicide as per instructions on the Venture L Herbicide label and then add Polaris MAX Herbicide as per instructions on this label.

This tank mix is to be applied when the crop is from the first trifoliate leaf stage through third trifoliate leaf stage and when the volunteer Roundup Ready corn is at the 2- to 5-leaf stage.

A PHI (preharvest interval) of 90 days is required for the tank-mix of Polaris MAX Herbicide and Venture L Herbicide on Roundup Ready2 Yield and Roundup Ready Soybeans.

Refer to the Venture L Herbicide label for further safety precautions and handling instructions.

7.8 WEED CONTROL IN CORN VARIETIES WITH ROUNDUP READY 2 TECHNOLOGY

**WARNING:** APPLY POLARIS MAX HERBICIDE ON ONLY CORN VARIETIES THAT ARE DESIGNATED AS CONTAINING ROUNDUP READY 2 TECHNOLOGY (I.E. CONTAINS A ROUNDUP READY GENE).

**NOTE:** CORN VARIETIES CONTAINING ROUNDUP READY 2 TECHNOLOGY ARE TOLERANT OF GLYPHOSATE, THE ACTIVE INGREDIENT IN POLARIS MAX HERBICIDE. ALWAYS USE PEDIGREED (I.E. CERTIFIED) CORN SEED DESIGNATED AS CONTAINING ROUNDUP READY 2 TECHNOLOGY. CORN WHICH IS NOT DESIGNATED AS CONTAINING ROUNDUP READY 2 TECHNOLOGY MAY BE DAMAGED OR DESTROYED BY THIS TREATMENT.

Weeds controlled by
Polaris MAX Herbicide plus extended control of annual grass and broadleaf weeds on the Primextra II Magnum label.

* 0.75 to 1.0 kilogram active ingredient atrazine per hectare is equivalent to 1.56 to 2.08 litres per hectare of Aatrex Liquid 480.

** 500 g ai/litre of 2,4-D formulation. Adjust rates accordingly for other 2,4-D formulations. Use only low volatile ester or amine formulations of 2,4-D. Some corn hybrids may be injured by an application of 2,4-D. It is recommended that the corn seed provider be contacted regarding the tolerance of the corn hybrid to be treated, to 2,4-D prior to application of this tank mix.

♦ Weeds will be more easily controlled and early crop competition avoided with applications made when the weeds are small. Control of weeds greater than 25 centimetres in height will be inconsistent, although some weeds may be controlled.

7.9 WEED CONTROL IN SWEET CORN VARIETIES WITH ROUNDUP READY 2 TECHNOLOGY

WARNING: APPLY POLARIS MAX HERBICIDE ON ONLY SWEET CORN VARIETIES THAT ARE DESIGNATED AS CONTAINING ROUNDUP READY 2 TECHNOLOGY (I.E. CONTAINS A ROUNDUP READY GENE).

NOTE: SWEET CORN VARIETIES CONTAINING ROUNDUP READY 2 TECHNOLOGY ARE TOLERANT OF GLYPHOSATE, THE ACTIVE INGREDIENT IN POLARIS MAX HERBICIDE. ALWAYS USE PEDIGREED (I.E. CERTIFIED) SWEET CORN SEED DESIGNATED AS CONTAINING ROUNDUP READY 2 TECHNOLOGY. SWEET CORN WHICH IS NOT DESIGNATED AS CONTAINING ROUNDUP READY 2 TECHNOLOGY MAY BE DAMAGED OR DESTROYED BY THIS TREATMENT.

</tbody>
</table>
Weeds will be more easily controlled and early crop competition avoided with applications made when the weeds are small. Control of weeds greater than 25 cm in height will be inconsistent, although some weeds may be controlled.

Plants not fully emerged at the time of application will escape treatment.

**TANK MIXES** - Do not apply Tank Mixes to sweet corn varieties with Roundup Ready 2 Technology

Allow a minimum of 30 days between application of this product and harvest.

**DO NOT APPLY BY AIR**

**7.10 WEED CONTROL IN ROUNDUP READY SUGAR BEETS**

**WARNING:** APPLY POLARIS MAX HERBICIDE ON ROUNDUP READY SUGAR BEET VARIETIES ONLY.

**NOTE:** ALWAYS USE PEDIGREED (CERTIFIED) SUGAR BEET SEED DESIGNATED AS ROUNDUP READY. SUGAR BEETS WHICH ARE NOT DESIGNATED AS ROUNDUP READY WILL BE DAMAGED OR DESTROYED BY THIS TREATMENT.

**DO NOT APPLY BY AIR.**

For weed control in Roundup Ready sugar beets apply 0.83 – 1.67 L/ha of Polaris MAX Herbicide to emerged weeds. Refer to “Annual Weed Control” and “Perennial Weed Control” (Sections 7.1 and 8.1, respectively) for a listing of weeds controlled.

Apply Polaris MAX Herbicide to emerged weeds up to 15 cm in height.

Up to four applications of Polaris MAX Herbicide may be applied to Roundup Ready sugar beets. Allow a minimum of 10 days between applications.

Do not exceed a total Maximum quantity of 7.31 L/ha of this product per season (e.g. the first application of up to 2.30 L/ha plus 3 applications of up to 1.67 L/ha).

Do not harvest Roundup Ready sugar beets within 30 days after the final application of Polaris MAX Herbicide.

**7.11 WEED CONTROL IN ROUNDUP READY ALFALFA VARIETIES (DO NOT APPLY TO ALFALFA GROWN FOR SEED PRODUCTION)**

**WARNING:** APPLY POLARIS MAX HERBICIDE TO ROUNDUP READY ALFALFA VARIETIES ONLY.

**NOTE:** ALWAYS USE PEDIGREED (I.E. CERTIFIED) ALFALFA SEED DESIGNATED AS ROUNDUP READY. ALFALFA SEED WHICH IS NOT DESIGNATED AS ROUNDUP READY WILL BE DAMAGED OR DESTROYED BY THIS TREATMENT.

ROUNDUP READY ALFALFA VARIETIES ARE TOLERANT OF GLYPHOSATE, THE ACTIVE INGREDIENT IN POLARIS MAX HERBICIDE.

**DO NOT APPLY BY AIR.**
Applications can be made from emergence until 5 days prior to cutting. A sequential treatment may be applied to Roundup Ready alfalfa varieties for control of late weed flushes.

Allow a minimum of 5 days between application and cutting of alfalfa. Additional applications of this product should be at least 25 days apart. **Total number of in-crop applications not to exceed 3 per growing season.**

**New Stand Establishment (Seedling Year):** Due to the biology and breeding constraints of alfalfa, up to 10 percent of the seedlings may not contain a Roundup Ready gene and will not survive or thrive after the first application of this product. To limit the undesirable effects of stand gaps created by the loss of alfalfa plants not containing a Roundup Ready gene, an application of this product should be applied at or before the 4 trifoliate leaf stage of alfalfa during the establishment (seedling) year.

Note: Where Roundup Ready alfalfa is grown with a companion or cover crop, or is overseeded with a second species, in-crop (over-the-top) applications of this product will eliminate the non-Roundup Ready (non-glyphosate tolerant) species.

### WEED CONTROL IN ROUNDUP READY ALFALFA VARIETIES

3Common milkweed should be 15-60 cm in height.  
4Yellow nutsedge should be 5-15 cm in height. |
7.12 HYBRID CORN SEED PRODUCTION USING THE RHS SYSTEM WITH ROUNDUP READY 2 TECHNOLOGY

DO NOT APPLY BY AIR

The RHS designation indicates that the corn contains technology that allows for tassel-only susceptibility to this product. Use of this product on corn hybrids or inbreds that are not designated as RHS or as corn containing Roundup Ready 2 Technology may result in severe crop injury and yield loss.

**Tassel Control**
This product may be used as an over-the-top broadcast application for tassel control in RHS corn inbred recipient lines in seed production fields planted with corn containing Roundup Ready 2 Technology as the pollen donor.

USE INSTRUCTIONS: This product may be applied for tassel control up from the 8 to the 13 leaf stage before flowering at use rates from 1.67 to 2.34 L/ha per application. Up to two applications for tassel control are permitted.

**Weed Control**
Refer Only to Section: 7.8 WEED CONTROL IN CORN VARIETIES WITH ROUNDUP READY 2 TECHNOLOGY

**Tank mixes:** See section 7.8.1 TANK MIXTURES for use rates, timings and restrictions. Note that only those tank mixtures for which the tank mixture partner herbicide products are registered for use on seed (inbred) corn may be used for weed control on RHS corn inbred recipient lines and corn inbred donor lines containing Roundup Ready 2 Technology.

8.0 PERENNIAL WEED CONTROL

ALWAYS READ PRECAUTIONS, GENERAL INFORMATION AND MIXING AND APPLICATION SECTIONS (3.0, 4.0 AND 5.0) PRIOR TO SPECIFIC APPLICATION INFORMATION IN ANY LABEL SECTION. DO NOT APPLY BY AIR.

When applied as recommended under the conditions described, this product will control the perennial weeds listed in the following table.
### 8.1 PERENNIAL WEED CONTROL WITH POLARIS MAX HERBICIDE

<table>
<thead>
<tr>
<th>WEED</th>
<th>GROWTH STAGE</th>
<th>RATE (L/ha)</th>
<th>WATER VOLUME (L/ha)</th>
<th>COMMENTS</th>
</tr>
</thead>
</table>
| **Quackgrass** (control, light to moderate infestations) | 3 to 4 green leaves or more | 1.67 | 50 - 300 | • Apply in clean water using flat fan nozzles.  
• Allow 3 or more days after treatment before tillage.  
• Refer to “Quackgrass” notes in section 8.2.1 for more information.  
• For higher volumes (i.e., 150 – 300 L/ha) an approved surfactant must be added at 0.5 L per 100 L of clean water (0.5% v/v). Refer to list in section 8.2.2. See also below. |
| **Quackgrass** (long term control, heavy infestations, high water volumes) | 3 to 4 green leaves or more | 1.67 – 4.67 | 50 - 300 | • Apply 3 or more days after treatment before tillage.  
• Rates higher than 1.67 L/ha will provide more consistent, longer term control, especially with heavier infestations and/or higher water volumes (i.e., 150 – 300 L/ha).  
• Refer to “Quackgrass” notes in section 8.2.1 for more information. |
| **Canada Thistle** | Rosette stage (summerfallow) | 1.67 | 50 - 100 | • Apply in clean water using flat fan nozzles.  
• Allow 10 or more days after treatment before tillage.  
• Refer to “Canada Thistle” notes in section 8.2.3 for more information. |
| **Canada Thistle** | Bud stage or beyond | 3.17 – 4.67 | 100 - 300 | • Allow 5 or more days after treatment before tillage. |
| **Field Bindweed** | Full bloom or beyond | 4.67 – 8 | 100 - 300 | • Allow 7 or more days after treatment before tillage. |
| **Common Milkweed** | Bud to full bloom (preharvest) | 1.67 | 50 – 100 | • See “Preharvest Treatment” (section 9.9) for more information.  
• Allow 7 or more days after treatment before tillage.  
• Reduced control may occur after full bloom.  
• Common milkweed may not all be in the correct stage, therefore, repeat treatments may be required. |
| **Common Milkweed** | Bud to full bloom | 8 | 100 - 300 | • See “Preharvest Treatment” (section 9.9) for more information.  
• Allow 7 or more days after treatment before tillage.  
• Reduced control may occur after full bloom.  
• Common milkweed may not all be in the correct stage, therefore, repeat treatments may be required. |

• Allow 7 or more days after treatment before tillage in summerfallow.  
• For more information, see "Toadflax Control" (section 8.2.4), or "Preharvest Treatment" (Section 9.9).                                                                                                                   |
|                   |             | Bud to full bloom (preharvest)   |             |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Alfalfa           |             | Early bud to full bloom stage    | 2.47 – 3.33 | 50 - 300            | • Allow 5 or more days after treatment before tillage.  Use the higher rates when alfalfa populations are high or when heavy grass infestations are also present.  
• For spring applications and control in minimum tillage systems using a 2,4-D tank mix, see section 8.2.6.                                                                                                                                                                                                                                                                                          |
|                   |             | Fall applications only           |             |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Dandelion         | < 15 cm     | 1.67          | 50 – 100    |                     | • Allow 3 or more days after treatment before tillage for all rates.  
• Use the higher rate when infestations are heavy.  
• Refer to "Dandelion" notes in section 8.2.5 for more information.  
• Allow 7 or more days after treatment before tillage.  For more information, see "Preharvest Treatment" (section 9.9).                                                                                                                                                                                                                                           |
|                   | > 15 cm     | 2.47 – 3.33   | 50 – 300    |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|                   | Rosette to full bloom (preharvest) | 1.67          | 50 – 100    |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Foxtail Barley    | Seedling to heading | 1.67 – 3.33 | 50 – 100    |                     | • Allow a minimum of 1 day after treatment before tillage or seeding.  
• Use higher rates for larger, more established plants, heavy infestations or if plants are stressed.                                                                                                                                                                                                                                                                                                      |
| Other Perennials  | Early heading or early bud stage | 4.67 – 8    | 100 - 300   |                     | • Allow 7 or more days after treatment before tillage.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| (see listing section 6.2) |             |              |             |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

*NOTE: For spot treatment, mix 80 millilitres of product in 5 litres of clean water per 100 m² (1.67 – 8 litres per hectare is approximately equivalent to 17 – 80 mL/100m², respectively).*
8.2 SPECIAL NOTES FOR PERENNIAL WEED CONTROL

8.2.1 QUACKGRASS

For season-long control on fall tilled ground: Apply 1.67 litres per hectare of this product in spring prior to seeding. Apply in 50 to 100 litres per hectare of clean water as described in the preceding table. Delay application until the majority of quackgrass plants have 4 to 5 green leaves. This stage usually occurs 1 to 4 weeks later on fall tilled ground than on undisturbed ground. Reduced control may result on ground tilled deeper than 15 centimetres.

NOTE: This treatment will provide season-long control of quackgrass on fall tilled ground. Reduced control will be experienced versus this product on non-fall tilled ground. Repeat treatments may be necessary.

Applications on forages should be followed by tillage 3 days or later and should be made when good growing conditions exist.

If a frost has occurred, wait several days to determine if the quackgrass has recovered. Quackgrass can be treated after a mild frost provided there are 3 to 4 green leaves actively growing at the time of application. Do not apply after the first damaging frost in the fall.

8.2.2 SURFACTANT INFORMATION

The following is a list of approved surfactants for use with Polaris MAX Herbicide for control of quackgrass:

Agral 90  Companion
Ag Surf

Always refer to surfactant label for specific instructions regarding use of that product.

8.2.3 CANADA THISTLE

Control of Canada Thistle at the rosette stage: to ensure the proper timing of application the following steps must be followed:

1. Conduct summerfallow tillage as usual and perform the last tillage operation between July 15th and August 1st.
2. Allow the thistles to regrow for a minimum of 5 weeks until they are a minimum of 15 centimetres in diameter and in the rosette stage of growth.

NOTE: Canada thistle can be treated after a mild frost provided the leaves are still green and actively growing at the time of application. Do not apply after the first damaging frost in the fall.

POLARIS MAX HERBICIDE PLUS BANVEL II HERBICIDE TANK MIXTURES

For control of Canada thistle (and perennial sow thistle) in summerfallow or in postharvest stubble, apply 1.13 litres per hectare Polaris MAX Herbicide plus 1.25 litres per hectare Banvel II Herbicide in 100 – 200 litres per hectare of clean water. In addition, add 350 millilitres per hectare of a non-ionic surfactant registered for use with this product, such as Agral 90, Ag-Surf or Companion.

For best results in summerfallow, cultivate in the spring and apply when the majority of thistles are 15 centimetres to 25 centimetres tall and before the bud stage. Cultivate 3 weeks after application.
In postharvest stubble, apply this tank mixture to actively growing thistles at least 2 weeks prior to a damaging frost.

**NOTE:** Grow only cereals, canola (including rapeseed), soybeans, field corn, sweet corn, or white beans after application of this tank mixture.

If application is made after September 1st, or if soil moisture levels are extremely low after application, crop injury may occur in the spring following application.

### 8.2.4 TOADFLAX

**Control of Toadflax in a Summerfallow Vegetative Stage**

To ensure the proper timing of application, the following steps must be followed:

1. Conduct summerfallow tillage as usual and perform the last tillage operation between July 10th and July 21st.
2. Allow toadflax to regrow for a minimum of 4 to 5 weeks until they are minimum of 15 centimetres tall and at a lush green vegetative stage.

**NOTE:** Toadflax can be treated after a mild frost provided the leaves are still green and actively growing at the time of application. Do not apply after the first damaging frost.

### 8.2.5 DANDELION

Applications should be made up to and including bloom for best results. Follow-up control measures should be used to manage new dandelions germinating from seed to maintain control throughout the season.

### 8.2.6 ALFALFA CONTROL WITH 2,4-D TANK MIX

The addition of 2,4-D may improve alfalfa control in situations where control may be more difficult to obtain, such as in minimum tillage systems where populations are heavy, and with spring applications.

For fall control of established stands of alfalfa, apply 1.67 to 3.33 litres per hectare Polaris MAX Herbicide and 1.2 to 2.4 litres per hectare of any 500 grams per litre 2,4-D amine or low volatile ester formulation in 100 to 200 litres of water per hectare. (Adjust product rates accordingly for other 2,4-D formulations).

For spring applications, use only the low rate of 2,4-D (i.e., 1.2 litres per hectare) and 1.67 to 3.33 litres per hectare Polaris MAX Herbicide. Only cereal crops not underseeded to legumes may be planted following spring applications of this tank mix, and a 14 day interval between application and planting is required.

Use the higher Polaris MAX Herbicide rates when perennial grasses are prevalent.

### 8.2.7 ALL PERENNIAL WEEDS

**Weed Stages:** Weeds must be at the proper stage for effective control. Refer to “Perennial Weed Control with Polaris MAX Herbicide” (section 8.1).

**Nozzle Type:** For best results with conventional boom equipment apply this product with 50 to 300 litres per hectare of clean water using flat fan nozzles and no more pressure than 275 kPa.
**Rhizome Dormancy:** Reduced control may result if rhizomes have become dormant. Dormancy may occur if soil fertility is low and/or the land has not been tilled for several years.

**Mowing Effects:** Mowing prior to application will reduce effectiveness unless weeds are allowed to regrow to the proper stage before application.

**Tillage Effects:** Fall or spring tillage prior to spring applications and tillage between harvesting and fall applications will reduce the effectiveness on perennial weeds. Follow-up tillage after application should be delayed 5 to 7 days for best results. See “Weed Control” tables (sections 7.1 and 8.1) for specific tillage interval for each weed.

**Rainfall Effects:** Heavy rainfall immediately after application may wash the chemical off the foliage and a repeat treatment may be required. Do not apply if rainfall is forecast for the time of application.

**Regrowth from Germinating Seeds:** This product only controls emerged plants. Repeat treatments or other weed control measures may be required to control weeds regenerating from seeds or other underground parts.

**Frost Effects:** Heavy frosts prior to application may reduce control. Do not apply after the first damaging frost in the fall.

**9.0 CROPLAND SITUATIONS**

**ALWAYS READ PRECAUTIONS, GENERAL INFORMATION AND MIXING AND APPLICATION SECTIONS (3.0, 4.0 and 5.0) PRIOR TO SPECIFIC APPLICATION INFORMATION IN ANY LABEL SECTION. DO NOT APPLY BY AIR EXCEPT FOR PREHARVEST AERIAL APPLICATION (SECTION 9.9.2).**

This product can be applied as a broadcast spray or spot treatment prior to planting all crops, postharvest to annual crops, preharvest in wheat, barley, oats, canola (rapeseed), flax (including low linolenic acid varieties), lentils, peas, soybeans, dry beans and forages, and in summerfallow. It may also be applied as a broadcast spray in Roundup Ready Corn 2, Roundup Ready soybeans or Roundup Ready canola varieties (sections 7.5, 7.6 and 7.7). It may be applied as a directed spray in orchards, vineyards, blueberries and strawberries, and using selective equipment in soy and dry beans, orchards, vineyards, cranberries and strawberries (refer to specific sections below for more information). For specific instructions on weed control in the following cropping situations, always refer to “Annual and Perennial Weed Control” (sections 7.0 and 8.0) for more information.

**9.1 PRIOR TO PLANTING – ALL CROPS**

This product may be applied prior to planting all crops for control of emerged weeds listed on this label. Ensure weeds are at the desired stage at the time of application. This product does not provide preemergent weed control and newly germinating weeds may be a problem in the crop. APPLY BEFORE SEEDING OR TRANSPLANTING.

**9.1.1 PRIOR TO PLANTING – TANK MIXES* - SOYBEANS**

*TANK MIXES – REFER TO THE RESPECTIVE PRODUCT LABELS WHEN TANK MIXING FOR USE RATES, CAUTIONS/WARNINGS, MIXING INSTRUCTIONS, RE-CROPPING RECOMMENDATIONS AND OTHER DETAILS.
WHERE TANK MIX PARTNER LABELS REFER ONLY TO THE OLDER (360 G/L) GLYPHOSATE PRODUCTS, E.G., ROUNDUP ORIGINAL OR ROUNDUP TRANSORB, ENSURE THAT THE LABEL RATE IS ADJUSTED TO COMPENSATE FOR THIS MORE CONCENTRATED PRODUCT.

**Polaris MAX Herbicide plus Pursuit Herbicide**

Polaris MAX Herbicide plus Pursuit Herbicide can be applied prior to or after seeding, but before crop emergence. Polaris MAX Herbicide will control emerged weeds listed on this label when applied as directed (refer to Annual and Perennial Weed control sections in the Polaris MAX Herbicide product label). Pursuit Herbicide will control weeds germinating from seed.

ONLY SOYBEANS, WHITE BEANS, KIDNEY BEANS, PROCESSING PEAS, FIELD CORN, SPRING BARLEY, SPRING WHEAT AND WINTER WHEAT MAY BE PLANTED THE SEASON FOLLOWING A PURSUIT APPLICATION. WINTER WHEAT MAY BE PLANTED THE SAME YEAR AS A PURSUIT APPLICATION TO SOYBEANS, BUT NOT EARLIER THAN 100 DAYS AFTER THE APPLICATION.

DO NOT APPLY AFTER CROP EMERGENCE

**Polaris MAX Herbicide plus metribuzin (Sencor 75 DF Herbicide, Sencor 500F Flowable Herbicide, Sencor 480F Flowable Herbicide, Sencor Soybean Flowable Herbicide, or Lexone DF Herbicide)**

For burndown and residual control of selected annual weeds taller than 4 cm in soybeans, apply Polaris MAX Herbicide in tank mix with Sencor 75 DF Herbicide, Sencor 500F Flowable Herbicide, Sencor 480F Flowable Herbicide, Sencor 480 Soybean Flowable Herbicide or Lexone DF Herbicide as a preplant surface or pre-emergence application before crop emergence.

Perennial weeds such as quack grass may not be controlled with lower rates of Polaris MAX Herbicide. Use higher rates of Polaris MAX Herbicide if perennial weeds are present.

**Polaris MAX Herbicide plus Dual Magnum Herbicide or Dual II Magnum Herbicide**

For burndown and residual control of selected annual weeds in soybeans. Apply Polaris MAX Herbicide in tank mix with Dual Magnum Herbicide or Dual II Magnum Herbicide at 1.15–1.75 L/ha as a preplant surface (up to 30 days before planting) or pre-emergence application before crop emergence.

Perennial weeds such as quack grass may not be controlled with lower rates of Polaris MAX Herbicide. Use higher rates of Polaris MAX Herbicide if perennial weeds are present.

**Polaris MAX Herbicide plus Broadstrike Dual Magnum Soybean Herbicide**

Broadstrike Dual Magnum Soybean Herbicide at 1.56 L/ha may be tank mixed with Polaris MAX Herbicide at 1.7 L/ha for control of existing annual weeds and certain perennial weeds including quack grass. This tank mix may be applied preplant surface or pre-emergence in minimum till or no-till conditions. When mixing, add the Broadstrike Dual Magnum Soybean Herbicide component first.

**Polaris MAX Herbicide plus Frontier MAX Herbicide**

For burndown and residual control of selected annual weeds apply Polaris MAX Herbicide plus Frontier MAX Herbicide preplant surface or pre-emergence.
Polaris MAX Herbicide plus linuron
For burndown and residual control of selected annual weeds apply Polaris MAX Herbicide plus linuron after seeding but before crop emergence.

Polaris MAX Herbicide plus Axiom DF Herbicide
Preplant Surface:
For use in conservation tillage, minimum-tillage or no-tillage crop production systems, when weeds are present at the time of application, apply the Axiom DF Herbicide treatment in tank mixture with Polaris MAX Herbicide. Apply Axiom DF Herbicide in a minimum of 200 L/ha of total volume.

Preemergence
Polaris MAX Herbicide plus Axiom DF Herbicide may be applied to the soil surface as a broadcast spray after planting of the crop, but prior to weed or crop emergence.

For conservation tillage systems: Apply this tank mixture in a minimum of 200 L/ha of total volume.

9.1.2 PRIOR TO PLANTING – TANK MIXES* - CORN

*TANK MIXES – REFER TO THE RESPECTIVE PRODUCT LABELS WHEN TANK MIXING FOR USE RATES, CAUTIONS/WARNINGS, MIXING INSTRUCTIONS, RE-CROPPING RECOMMENDATIONS AND OTHER DETAILS.

WHERE TANK MIX PARTNER LABELS REFER TO ONLY TO OLDER (360 G/L) GLYPHOSATE PRODUCTS, E.G. ROUNDUP ORIGINAL OR ROUNDUP TRANSORB, ENSURE THAT THE LABEL RATE IS ADJUSTED TO COMPENSATE FOR THIS MORE CONCENTRATED PRODUCT.

Polaris MAX Herbicide plus Dual Magnum Herbicide or Dual II Magnum Herbicide
For burndown and residual control of selected annual weeds in corn. Apply Polaris MAX Herbicide in tank mix with Dual Magnum or Dual II Magnum at 1.25 to 1.75 L/ha as a preplant surface (up to 30 days before planting) or pre-emergence application before crop emergence. NOTE: The use on corn is for EASTERN CANADA ONLY.

Perennial weeds such as quack grass may not be controlled with lower rates of Polaris MAX Herbicide. Use higher rates of Polaris MAX Herbicide if perennial weeds are present.

Polaris MAX Herbicide plus Dual Magnum Herbicide or Dual II Magnum Herbicide plus Aatrex Liquid 480 Herbicide
For burndown and residual control of selected annual weeds in corn. Apply Polaris MAX Herbicide in tank mix with Dual Magnum Herbicide or Dual II Magnum Herbicide at 1.25 – 1.75 L/ha plus Aatrex Liquid 480 Herbicide at 2.1 - 3.1 L/ha as a preplant surface (up to 30 days before planting) or pre-emergence application before crop emergence. NOTE: The use on corn is for EASTERN CANADA ONLY.

Perennial weeds such as quack grass may not be controlled with lower rates of Polaris MAX Herbicide. Use higher rates of Polaris MAX Herbicide if perennial weeds are present.

Polaris MAX Herbicide plus Primextra II Magnum Herbicide
For burndown and residual control of selected annual weeds in corn apply Polaris MAX Herbicide plus Primextra II Magnum preplant surface or pre-emergence application before crop emergence. This tank mixture requires the use of a surfactant, either Agral 90 or Ag-Surf. See mixing instructions for more information.
Perennial weeds such as quack grass may not be controlled with lower rates of Polaris MAX Herbicide. Use higher rates of Polaris MAX Herbicide if perennial weeds are present.

**Polaris MAX Herbicide plus Fieldstar Herbicide**
For burndown and residual control of selected annual weeds apply Polaris MAX Herbicide plus Fieldstar Herbicide as a preplant surface or pre-emergence application before crop emergence.

**Polaris MAX Herbicide plus Frontier MAX Herbicide**
For burndown and residual control of selected annual weeds apply Polaris MAX Herbicide plus Frontier MAX Herbicide as a preplant surface or pre-emergence application before crop emergence.

**Polaris MAX Herbicide plus Prowl 60 WDG Herbicide**
For burndown and residual control of selected annual weeds apply Polaris MAX Herbicide plus Prowl 60 WDG herbicide after seeding but before crop emergence.

**Polaris MAX Herbicide plus Linuron 400 L herbicide**
For burndown and residual control of selected annual weeds apply Polaris MAX Herbicide plus Linuron 400 L herbicide after seeding but before crop emergence.

**Polaris MAX Herbicide plus Converge Pro Herbicide or Converge 75 WDG Herbicide**

**Surface Preplant**
CONVERGE 75 WDG Herbicide can be applied to the soil surface up to 14 days prior to planting. CONVERGE 75 WDG Herbicide must be tankmixed with atrazine when applied as a surface preplant application. When weed growth is present at the time of application, Polaris MAX Herbicide can be added to the Converge Pro Herbicide or Converge 75 WDG Herbicide + atrazine treatment for burndown control of these weeds. Do not incorporate.

**Preemergence**
Converge Pro Herbicide or Converge 75 WDG Herbicide can also be applied after planting to just prior to crop emergence. Atrazine and/or Polaris MAX Herbicide can be tank mixed with pre-emergent applications of Converge Pro Herbicide or Converge 75 WDG Herbicide.

Apply Converge Pro Herbicide at 165-220 mL per hectare, or Converge 75 WDG Herbicide at 105-140 g per hectare, tankmixed with Polaris MAX Herbicide at 1.67 L per hectare for burndown control of emerged weeds in all tillage management systems and improved control of established dandelion in zero-tillage management systems. A three-way tankmix of Converge Pro Herbicide or Converge 75 WDG Herbicide + atrazine + Polaris MAX Herbicide can be used to provide residual control of the weeds listed in the Converge Pro Herbicide or Converge 75 WDG Herbicide + atrazine section.

**Polaris MAX Herbicide plus Axiom DF Herbicide**

**Preplant Surface**
For use in conservation tillage, minimum-tillage or no-tillage crop production systems, when weeds are present at the time of application, apply the Axiom DF Herbicide treatment in tank mixture with Polaris MAX Herbicide. Apply Axiom DF Herbicide in a minimum of 200 L/ha of total volume.

**Preemergence**
Polaris MAX Herbicide plus Axiom DF Herbicide may be applied to the soil surface as a broadcast spray after planting of the crop, but prior to weed or crop emergence.

For conservation tillage systems:
Apply this tankmix in a minimum of 200 L/ha of total volume.
9.2 POSTHARVEST STUBBLE TREATMENT

This product may be applied in the fall as a postharvest stubble treatment for control of perennial weeds such as quackgrass and Canada thistle. Allow weeds to regrow to the desired stage (20 to 25 centimetres tall for quackgrass and Canada thistle) before application and ensure they have a high proportion of green colouration. Straw should be removed or evenly spread to allow for proper regrowth and spray coverage. Heavy frosts prior to application may decrease control.

9.3 SPOT TREATMENT (IN-CROP)

This product can be applied as an in-crop spot treatment in barley, corn, oats, soybeans, wheat, strawberry, blueberry, forage grasses and legumes including seed production. Applications should be made using the same rates and at the same growth stages as listed in the “Weed Control” tables (sections 7.1 and 8.1) or use a 0.67 percent solution for annual weeds and quackgrass and a 1.34 percent solution for other perennial weeds (a 0.67 percent solution equals 0.67 litres of Polaris MAX Herbicide in 100 litres of spray solution). 0.67 and 1.34 percent solutions should be applied to wet, but not run-off. Applications can be made using a boom sprayer, hose and handgun, or hand sprayer in accordance with instructions in “Application Equipment” (section 5.2).

9.3.1 Grazing Restrictions: Applications can be made up to heading of small grains, initial pod set on soy and dry beans, silking of corn and emergence of seed heads. The crop in the treated area will be killed. Take care to avoid drift for the same reason. **DO NOT APPLY IF CROP GROWTH HAS ADVANCED BEYOND SEED SET. ALLOW 3 TO 5 DAYS FOR POLARIS MAX HERBICIDE TO TRANSLOCATE INTO ALL PLANT PARTS BEFORE GRAZING OR HARVESTING TREATED AREAS IN FORAGES.**

9.4 SUMMERFALLOW TREATMENT

This product, or labeled tank mixtures, may be applied in summerfallow to control weeds listed on this label. Ensure weeds are at the desired growth stage and actively growing at application for best results. Reduced control may result if weeds are drought stressed. Weeds will continue to germinate from seed throughout the growing season. Repeat treatments may be necessary to control later germinating weeds.

9.5 MINIMUM AND ZERO TILLAGE CROPPING SYSTEMS (ALL FIELD CROPS, INCLUDING CEREALS, OILSEEDS, PULSES, FORAGES, CORN AND POTATOES)

This product may be applied prior to seeding or after seeding, but before crop emergence for control of emerged weeds in minimum and zero tillage cropping systems for all field crops. Applications made too far in advance of seeding may allow weeds to emerge between application and crop emergence, as this product does not provide residual weed control.

**MINIMUM AND ZERO TILLAGE TANK MIXTURES**

9.5.1 Polaris MAX Herbicide plus 2,4-D amine or ester can be applied prior to seeding or after seeding, but before crop emergence in wheat, winter wheat, barley and rye. Refer to “Annual Weed Control with 6 Tank Mixtures” table for information (section 7.2).

9.5.2 Polaris MAX Herbicide plus bromoxynil (Pardner) can be applied prior to seeding or after seeding, but before crop emergence in wheat, barley and oats. Refer to “Annual Weed Control with Polaris MAX Herbicide Tank Mixtures” table for information (section 7.2).
9.5.3 **Polaris MAX Herbicide plus Pursuit** can be applied prior to, or after seeding, but before crop emergence in soybeans. **Polaris MAX Herbicide** will control emerged weeds listed on this label when applied as directed (refer to “Annual and Perennial Weed Control” section 7.0 and 8.0). Pursuit will control weeds germinating from seed. Add the recommended rates of both products in 100 litres of water per hectare, following the instructions on the Pursuit herbicide label.

ALWAYS REFER TO THE PURSUIT LABEL FOR FURTHER INFORMATION ON WEEDS CONTROLLED, APPLICATION DIRECTIONS, AND USE PRECAUTIONS. ONLY SOYBEANS, FIELD CORN, SPRING BARLEY, SPRING WHEAT AND WINTER WHEAT MAY BE PLANTED THE SEASON FOLLOWING A PURSUIT APPLICATION. WINTER WHEAT MAY BE PLANTED THE SAME YEAR AS A PURSUIT HERBICIDE APPLICATION TO SOYBEANS, BUT NOT EARLIER THAN 120 DAYS AFTER THE APPLICATION.

DO NOT APPLY AFTER CROP EMERGENCE.

9.5.4 **Polaris MAX Herbicide plus MCPA** can be applied prior to seeding in wheat, barley, rye, oats, corn (field and sweet; MCPA amine only), flax and field peas (MCPA amine only). Refer to “Annual Weed Control with Polaris MAX Herbicide Tank Mixtures” table for information (section 7.2).

9.5.5 **Polaris MAX Herbicide plus Buctril M** can be applied prior to seeding in wheat, rye, corn, barley, oats, flax, canary seed and seedling grasses (including brome grass, crested wheatgrass, intermediate wheat grass, slender wheatgrass, tall wheatgrass, Russian wild rye, timothy, orchard grass, creeping red fescue, meadow fescue, meadow foxtail, seedling tall fescue, seedling meadow bromegrass, seedling streambank wheatgrass and reed canary grass). Refer to “Annual Weed Control with Polaris MAX Herbicide Tank Mixtures” table for information (section 7.2).

9.5.6 **Polaris MAX Herbicide plus MCPA amine** can be applied prior to seeding in lentil and chickpea. Refer to “Annual Weed Control with Polaris MAX Herbicide Tank Mixtures” table for information (section 7.2).

9.5.7 **Polaris MAX Herbicide plus Express Toss-N-Go Herbicide Or Express Toss-N-Go Dry Flowable 75% Herbicide** in pre-seed situations, wheat and barley may be seeded after a minimum of 24 hours after application. Refer to “Annual Weed Control with Polaris MAX Herbicide Tank Mixtures” table for information (section 7.2).

ALWAYS REFER TO THE EXPRESS TOSS-N-GO HERBICIDE OR EXPRESS TOSS-N-GO DRY FLOWABLE 75% HERBICIDE LABEL FOR FURTHER INFORMATION ON APPLICATION DIRECTIONS, TANK MIXING, AND USE PRECAUTIONS.

9.5.8 **Polaris MAX Herbicide plus Banvel II Herbicide** can be applied prior to seeding in wheat, barley, rye, oats and field corn only (do not apply prior to seeding sweet corn). Refer to “Annual Weed Control with Polaris MAX Herbicide Tank Mixtures” table for information (section 7.2).

9.6 **FORAGES LEGUMES AND GRASSES**

This product may be applied for control of emerged weeds prior to emergence of forage legumes and grasses. If the forages are to be under-seeded with a cover crop, this product must be applied prior to planting the cover crop.
9.7 PASTURE RENOVATION

Use this product to control or suppress existing vegetation for zero-tillage seeding of legumes into established sod for pasture renovation. Delay spraying until weed growth is at least 20 centimetres in height and a Maximum number of seedlings or shoots have emerged. Application can be made immediately before, during or after seeding, but before crop emergence.

9.8 FORAGE SEED PRODUCTION

For spot treatment control of perennial weed problems such as quackgrass and Canada thistle in seed fields, apply as directed to vegetation that is at least 20 to 25 centimetres in height but before emergence of seed head. The crop in the treated areas will be killed. Take care to avoid drift outside target areas for the same reason.

9.9 PREHARVEST TREATMENT

CONTROL OF QUACKGRASS, CANADA THISTLE, MILKWEED, TOADFLAX AND DANDELION; SEASON-LONG CONTROL OF PERENNIAL SOW THISTLE, AND HARVEST MANAGEMENT

For control of quackgrass, Canada thistle, common milkweed, toadflax and dandelion; and season-long control of perennial sow thistle, Polaris MAX Herbicide can be applied prior to harvest of wheat, barley (including malting barley), oats, canola (rapeseed) (including Roundup Ready varieties), flax (including low linolenic acid varieties), lentils, peas, dry beans, soybeans (including Roundup Ready varieties) and forages. DO NOT apply to crops if grown for seed production.

This treatment may also provide harvest management benefits, by drying down crop and weed vegetative growth, for example, where late flushes of annual weeds, green vegetative crop growth, or late tillering may interfere with harvest operations. EXTREMELY COOL, WET AND/OR CLOUDY WEATHER CONDITIONS BETWEEN THE TIME OF APPLICATION AND THE ANTICIPATED HARVEST DATE MAY SLOW DOWN ACTIVITY OF THIS PRODUCT, THEREBY DELAYING CROP DRYDOWN AND HARVEST DATE. Preharvest treatment to Roundup Ready varieties of canola and soybean provides weed control only.

Polaris MAX Herbicide should be applied preharvest at 1.67 litres per hectare in 50 to 100 litres per hectare of clean water, by ground application only. Apply only when the crop has 30 percent or less grain moisture content. This stage typically occurs 7 to 14 days before harvest. For forage crops, apply this product at 1.67 to 3.33 litres per hectare 3 to 7 days prior to the last cut before rotation or forage renovation. Consult the table “Guidelines for Timing of Preharvest Applications” (section 9.9.1) for visual indicators of this stage in each crop. For the best weed control results, quackgrass should be actively growing and have at least 4 to 5 green leaves.

Canada thistle and perennial sow thistle should be actively growing and at or beyond the bud stage for best results. Common milkweed should be at the bud to bloom stage and actively growing for best results. Applications for weed control (not for harvest management) must be made at the correct stage of both weed and crop growth.

Apply only during the period 7 to 14 days (or 3 to 7 days for forage applications) before harvest to ensure best weed control and to MAX Herbicideimize harvest management benefits. Earlier application may reduce crop yield and/or quality, and may lead to excess glyphosate residues in the crop.

DO NOT APPLY BY AIR.

**NOTE TO USER: READ THE FOLLOWING BEFORE USING THIS PRODUCT FOR THE INDICATED SPECIAL USE APPLICATIONS: (PREHARVEST TREATMENT OF CHICKPEA, DRIED LUPIN AND DRIED FAVA BEAN).**

The DIRECTIONS FOR USE for this product described below were developed by persons other than Production Agriscience Canada Company and accepted for registration by Health Canada under the User Requested Minor Use Label Expansion program. Production Agriscience Canada Company itself makes no representation or warranty with respect to performance (efficacy) and/or crop tolerance (phytotoxicity) claims for this product when used on the crop listed below.

Accordingly, the Buyer and User assume all risks related to performance and crop tolerance liability arising, and agree to hold Production Agriscience Canada Company harmless from any claims based on efficacy and/or phytotoxicity in connection with the uses described below.

**DIRECTIONS FOR USE**

**Preharvest Treatment of Chickpea, Dried Lupin and Dried Fava Bean**

For control of quackgrass, Canada thistle, common milkweed, toadflax and dandelion; and season-long control of perennial sow thistle and harvest management, **Polaris MAX Herbicide** can be applied prior to harvest of chickpea, dried lupin and dried fava bean. DO NOT apply to crops if grown for seed production.

**Polaris MAX Herbicide** should be applied preharvest at 1.67 litres per hectare in 50 to 100 litres per hectare of clean water, by ground application only. Apply only when the crop has 30 percent or less grain moisture content. This stage typically occurs 7 to 14 days before harvest. For further information, see guidelines above. The Pre-harvest interval is 7 days.

ALWAYS REFER TO THE PRODUCT LABEL FOR FURTHER INFORMATION ON WEEDS CONTROLLED, APPLICATION DIRECTIONS, AND USE PRECAUTIONS

9.9.2 PREHARVEST AERIAL APPLICATION

Refer to the general guidelines for aerial application in Sections 5.2 and 5.3 as well as specific instructions in this section.

RESTRICTED USE

AERIAL PREHARVEST APPLICATION
PRAIRIE PROVINCES ONLY (including PEACE RIVER REGION OF B.C.)

NOTICE TO USER: This pest control product is to be used only in accordance with the directions on the label. It is an offence under the Pest Control Products Act to use this product in a way that is inconsistent with the directions on the label.

NATURE OF RESTRICTION: This product is to be used only in the manner authorized. For use only by aerial applicators and aerial application services approved by the provincial regulatory agency to apply this product with aerial application equipment. To qualify for consideration of provincial approval, the following requirements must be demonstrated to the provincial regulatory agency:

1. Aircraft used in the application of this product must have been configured and calibrated to acceptable standards at a recognized calibration (patternation) clinic within 20 months of the date of application. The spray system must not have been subjected to major changes (new nozzles, booms or configurations) since the calibration, and must meet critical drift management standards e.g. Maximum boom width 65% of wing span; nozzle type, size and orientation to minimize drift and deliver droplet size VMD in the coarse (400 – 600 microns) or very coarse (600 – 1000 microns) range.
2. Aircraft used in the application of this product must carry a minimum of $25,000 drift insurance in addition to any provincial requirements for general comprehensive insurance coverage.
3. Applicators using this product must have successfully completed a Polaris MAX Herbicide aerial application training course provided by Monsanto Canada Inc.
4. Aerial application services applying this product must employ on staff at least one pilot applicator with at least 250 hours of actual aerial application time and a minimum of 100 hours within the last 24 month period. All pilots who do not meet the minimum experience standard must work under the direct daily supervision of a qualified pilot.

Refer to general directions and precautions concerning aerial application, sections 5.2, and 5.3, Buffer Zones.
DIRECTIONS FOR USE
Polaris MAX Herbicide may be applied with aerial application equipment for control of quackgrass, Canada thistle, common milkweed, toadflax and dandelion, and season-long control of perennial sow thistle. Polaris MAX Herbicide can be applied prior to harvest of wheat, barley (including malting barley), oats, canola (rapeseed), flax (including low linolenic acid varieties), lentils, peas, dry beans and soybeans. Do not use on forages. **DO NOT apply to any crops if grown for seed production.**

This treatment may also provide harvest management benefits, by drying down crop and weed vegetative growth, for example, where late flushes of annual weeds, green vegetative crop growth, or late tillering may interfere with harvest operations.

**EXTREMELY COOL, WET AND/OR CLOUDY WEATHER CONDITIONS BETWEEN THE TIME OF APPLICATION AND THE ANTICIPATED HARVEST DATE MAY SLOW DOWN ACTIVITY OF THIS PRODUCT, THEREBY DELAYING CROP DRYDOWN AND HARVEST DATE.**

Polaris MAX Herbicide should be applied at 1.67 L/ha in 20 – 50 L/ha of clean water with aerial application equipment. Apply only when the crop has 30% of less grain moisture content. This stage typically occurs 7 to 14 days before harvest. Consult the table “Guidelines for Timing of Preharvest Applications” (Section 9.9.1) for visual indicators of this stage in each crop. For the best weed control results quackgrass should be actively growing and have at least 4 to 5 green leaves. Canada thistle and perennial sow thistle should be actively growing and at or beyond the bud stage for best results. Common milkweed should be at the bud to bloom stage and actively growing for best results. Applications for weed control (not for harvest management) must be made at the correct stage of both weed and crop growth.

Apply only during the period 7 – 14 days before harvest to ensure best weed control and to maximize harvest management benefits. Earlier application may reduce crop yield and/or quality, and may lead to excess glyphosate residues in the crop.

9.10 TREE PLANTINGS

SHELTERBELTS AND NURSERY STOCK (WOODY ORNAMENTALS)
This product may be used to control listed annual or perennial weeds prior to planting, or as a post directed spray in established nurseries or shelterbelts of the following species:

**DECIDUOUS**
- Ash  
  *Fraxinus spp.*
- Caragana  
  *Caragana spp.*
- Cherry  
  *Prunus spp.*
- Elm  
  *Ulmus spp.*
- Lilac  
  *Syringa spp.*
- Maple  
  *Acer spp.*
- Mountain Ash  
  *Sorbus spp.*
- Poplar  
  *Populus spp.*

**CONIFEROUS**
- Fir  
  *Abies spp.*
- Juniper  
  *Juniperus spp.*
- Pine  
  *Pinus spp.*
- Spruce  
  *Picea spp.*
- Yew  
  *Taxus spp.*
Russian Olive
_Elaeagnus spp._

Willow
_Salix spp._

**NOTE:** This product is not recommended for use as an over-the-top broadcast spray in forest tree nurseries or in Christmas tree plantations. Application in such sites should be limited to directed sprays. DO NOT treat Christmas tree plantations in the year of anticipated harvest.

### 9.11 TREE, VINE, BERRY AND OTHER CROPS

This product is recommended for annual and perennial weed control in established vineyards or orchards, in blueberry, cranberry and strawberry, or for site preparation prior to transplanting tree and vine crops. Applications may be made with boom equipment, shielded sprayers, hand held and high volume orchard guns, or with wiper applicator equipment (orchards, vineyards, cranberry and strawberry only). See “Mixing and Application Equipment Information” (section 5.2) and the following table for specific information on the use of equipment. Repeat treatments may be necessary to control weeds originating from underground parts of untreated weeds or from seeds. This product does not provide residual or pre-emergent weed control. For subsequent weed control, follow a program using residual herbicides or use repeated applications of this product. Do not apply more than 23 litres of this product per hectare per year.

**EXTREME CARE MUST BE EXERCISED TO AVOID CONTACT OF HERBICIDE SOLUTION, SPRAY, DRIFT, OR MIST WITH FOLIAGE OR GREEN BARK OF TRUNK, BRANCHES, SUCKERS, FRUIT, CANES OF BLUEBERRY BUSHES, OR OTHER PARTS OF TREES OR VINES. CONTACT OF THIS PRODUCT WITH OTHER THAN MATURER BROWN BARK CAN RESULT IN SERIOUS CROP DAMAGE.**

Reduced control may result when applications are made to annual or perennial weeds that have been mowed, grazed or cut and have not been allowed to regrow to the recommended stage for treatment.

**SHORT ROTATION INTENSIVE CULTURE (SRIC) POPLAR** *(Populus spp)*

DO NOT APPLY BY AIR.

This product may be used to control listed annual or perennial weeds prior to planting, or as a post directed spray in established crops of short rotation intensive culture (SRIC) Poplar species *(Populus spp.)*

**EXTREME CARE MUST BE EXERCISED TO AVOID CONTACT OF HERBICIDE SOLUTION, SPRAY, DRIFT, OR MIST WITH FOLIAGE OR GREEN BARK OF TRUNK, BRANCHES, OR OTHER PARTS OF TREES. CONTACT OF THIS PRODUCT WITH OTHER THAN MATUERED BROWN BARK CAN RESULT IN SERIOUS CROP DAMAGE.**

Reduced control may result when applications are made to annual or perennial weeds that have been mowed, grazed or cut and have not been allowed to regrow to the recommended stage for treatment.

Polaris MAX Herbicide may be applied prior to planting or as a post directed spray in established short rotation intensive culture crops. Apply Polaris MAX Herbicide up to 8 L/ha in 50 – 100 liters or 150 – 300 L/h for quackgrass control by ground application only. Applications can be made 1-3 times per year during establishment however, not to exceed the limit of 8 L/ha per year. Shielded sprayers must be utilized when applying post directed spray solutions. Allow a 6-8 week interval between spray applications. Apply to actively growing weeds.
NOTE TO USER: READ THE FOLLOWING BEFORE USING THIS PRODUCT FOR INDICATED SPECIAL USE APPLICATIONS: (NORTH AMERICAN GINSENG).

The DIRECTIONS FOR USE for this product for the uses described below were developed by persons other than Production Agriscience Canada Company and accepted for registration by Health Canada under the User Requested Minor Use Label Expansion program. Production Agriscience Canada Company itself makes no representation or warranty with respect to performance (efficacy) and/or crop tolerance (phytotoxicity) claims for this product when used on the crop listed below.

Accordingly, the Buyer and User assume all risks related to performance and crop tolerance arising, and agree to hold Production Agriscience Canada Company harmless from any claims based on efficacy and/or phytotoxicity in connection with the uses described below.

**DIRECTIONS FOR USE**
ALWAYS REFER TO THE PRODUCT LABEL FOR FURTHER INFORMATION ON WEEDS CONTROLLED, APPLICATION DIRECTIONS, AND USE PRECAUTIONS.

**NORTH AMERICAN GINSENG**

**New Gardens (British Columbia only):** Apply this product in the fall after seeding but before freeze-up in new gardens only to control volunteer cereals. Apply when weeds are at the growth stages listed on the product label. Use a single application of 1.67 litres per hectare in 50 to 100 litres water per hectare. DO NOT USE A FALL APPLICATION IN ESTABLISHED/EXISTING GARDENS.

**Existing/Established Gardens:** Apply this product in the spring before the crop has emerged above the soil. Apply when weeds are at the growth stages described in the product label. A Maximum of two 1.67 litres per hectare applications in 50 to 100 litres water per hectare may be made in a season. DO NOT USE A FALL APPLICATION IN ESTABLISHED/EXISTING GARDENS.

---

**9.12 SELECTIVE EQUIPMENT**

**WIPER APPLICATORS**
This product may be applied with a wiper applicator, after dilution and thorough mixing with water, to listed weeds in soy and dry beans, grapes, orchards, cranberries, lowbush blueberries and strawberries. Applications must be made before initial pod set in soy and dry beans. (It may also be used in any industrial, tree planting and non-crop site specified on this label. See sections 9.10 and 10.1).

A wiper applicator applies the herbicide solution onto weeds by rubbing the weed with an absorbent material containing the herbicide solution. Wiper applicators include either roller or wick devices which physically wipe appropriate concentrations or amounts of this product directly onto the weed. Equipment must be designed, maintained and operated to prevent the herbicide solution from contacting desirable vegetation. Performance may be improved by reducing speed in areas of heavy weed infestations to insure adequate wiper saturation. Best results may be obtained if 2 applications are made in opposite directions.

**AVOID CONTACT WITH DESIRABLE VEGETATION.** Contact of the herbicide solution with desirable vegetation may result in damage or destruction. Applicators used above desired vegetation should be adjusted so that wiper contact point is at least 5 centimetres above the desirable vegetation. Droplets or foam of the herbicide solution settling on desirable vegetation may result in discoloration, stunting or destruction.
Applications should be made when the weeds are a minimum of 15 centimetres above the desirable vegetation. Best results may be obtained when more of the weed is exposed to the herbicide solution. Weeds not contacted by the herbicide solution will not be affected. This may occur in dense clumps, severe infestations, or when the height of the weeds varies so that not all weeds are contacted. In these instances, repeat treatments may be necessary. See the “Weed Control” tables (sections 7.1 and 8.1) for recommended stage of growth for specific weeds.

NOTES

- Maintain equipment in good operating condition. Avoid leakage or dripping onto desirable vegetation.
- Adjust height of applicator to insure proper contact with weeds.
- Keep wiping surfaces clean.
- Maintain recommended roller RPM on roller applicators while in use.
- Keep wiper material at proper degree of saturation with herbicide solution.
- DO NOT use wiper equipment when weeds are wet.
- DO NOT operate equipment at ground speeds below 4 and greater than 10 kilometres per hour. Weed control may be affected by speed of application equipment. As weed density increases, reduce equipment ground speed to insure good coverage of weeds.
- Be aware that on sloping ground the herbicide solution may migrate, causing dripping on the lower end and drying on the upper end of the wiper applicator.
- Variation in equipment design may affect weed control. With wiper applicators, the wiping material and its orientation must allow delivery of sufficient quantities of the recommended herbicide solution directly to the weed.
- Care must be taken with all types of wipers to insure that the absorbent material does not become over-saturated, causing the herbicide to drip onto desirable vegetation.
- With all equipment, drain and clean wiper parts immediately after using this product, by thoroughly flushing with water.

For Roller Applicators – Mix 0.33 to 0.67 litres of this product in 10 litres water to prepare a 3 to 7 percent solution. Roller speed should be maintained at 50 to 150 RPM.

For Wick or other Wiper Applicators – Mix 0.57 litres of this product in 2 litres of water to prepare a 22 percent solution.

10.0 NON-CROPLAND USES

INDUSTRIAL, RIGHTS-OF-WAY, RECREATIONAL, AND PUBLIC AREAS.

ALWAYS READ PRECAUTIONS, GENERAL INFORMATION AND MIXING AND APPLICATION SECTIONS (3.0, 4.0 AND 5.0) PRIOR TO SPECIFIC APPLICATION INFORMATION IN ANY LABEL SECTION.

This product can be used to control annual and perennial weeds and woody brush and trees listed on this label in non-crop areas such as railroad, pipeline, highway, power and telephone rights-of-way, petroleum tank farms and pumping installations; roadides; storage areas; lumberyards; fence rows; industrial plant sites; parking areas; school yards, parks, golf courses, other public areas; airports and similar industrial or non-crop areas.

NOTE: For all industrial, rights-of-way, recreational and public areas, repeat treatments may be necessary to control regeneration or new growth.

When applied as recommended under the conditions described, this product will control weeds in non-cropland areas as listed in the following table.
## 10.1 Weed Control in Non-Cropland Areas with Polaris Max Herbicide

</table>

* For more information on rates, water volumes and application, refer to "Annual and Perennial Weed Control" (sections 7.1 and 8.1, respectively).

10.2 APPLICATION INFORMATION FOR NON-CROPLAND USES

FOLIAR APPLICATIONS
Spray coverage should be uniform and complete. Do not spray to the point of run-off. Do not allow spray drift to contact desirable vegetation as severe injury or destruction may occur. For woody brush and trees, early season applications may take 30 to 45 days for symptoms to develop on target species. Late season application may be made to species that have some autumn colors provided no major leaf drop has occurred. Control will be observed the following spring.

EXTREME CARE MUST BE EXERCISED TO AVOID CONTACT OF SPRAY WITH FOLIAGE OF DESIRABLE TURF GRASSES, TREES, SHRUBS, OR OTHER DESIRABLE VEGETATION SINCE SEVERE DAMAGE OR DESTRUCTION MAY RESULT.

This product does not provide residual weed control. For subsequent weed control, follow a label approved herbicide program. Read and carefully observe the cautionary statements and all other information appearing on the labels of all herbicides used.

10.2.1 GROUND APPLICATIONS:

For all non-cropland uses
For woody brush and trees, apply 2 to 4 litres of this product per hectare. Use ground boom or boomless, or mist blower equipment, or apply as a 0.67 to 1.34 percent solution using hand held, high volume equipment. Apply as directed in the recommended volume of clean water to foliage of actively growing vegetation. Use the 4 litres per hectare rate for Maple, Alder and Willow* species, as well as for hard to control perennial weed species. (*suppression only).

Spray coverage should be uniform and complete. Do not spray to the point of run-off. Do not allow spray drift to contact desirable vegetation as severe injury or destruction may occur. If weeds have been mowed or tilled, do not treat until regrowth has reached the recommended stages.
10.2.2 PURPLE LOOSESTRIFE CONTROL

- **DO NOT TREAT PLANTS OVER OPEN WATER.** Polaris MAX Herbicide is not registered for direct application to bodies of water.
- Treat when plants are actively growing at or beyond the bloom stage. If using hand held equipment, spray-to-wet.
- For wiper applications see section 9.12.
- Where feasible, remove flower heads before treatment to ensure prevention of seed set.
- For large (>1.6 ha) monocultures of loosestrife, work from the periphery inward in successive years to allow competing vegetation to invade the treated area.
- A long-term control strategy should include measures to control both established plants and seedlings. Sprayed areas should be monitored to determine the appropriate follow-up management. Early detection and treatment of second and third generation seedlings is important to prevent re-infestation of purple loosestrife. Desirable native plant communities will then have a chance to become re-established.

10.3 SELECTIVE APPLICATION FOR ALL NON-CROPLAND USES

Selective equipment such as WIPER and ROLLER applicators can be used to control emerged weeds in non-crop areas and tree plantings. See “Selective Equipment” (section 9.12) for more information.

10.4 TURF GRASS

When applied as directed, under conditions described, this product controls most existing vegetation. Apply this product at rates specified in “Weed Control in Non-Cropland Areas” (section 10.1).

**DO NOT DISTURB SOIL OR UNDERGROUND PLANT PARTS BEFORE TREATMENT.**

Where existing vegetation is growing in a field or unmowed situation, apply this product to actively growing weeds at the stages of growth given in “Weeds Controlled” (sections 7.1 and 8.1, respectively). Where existing vegetation is growing under mowed turfgrass management, apply this product after omitting at least one regular mowing to allow sufficient growth for good interception of the spray and proper translocation into underground plant parts. Tillage or renovation techniques such as vertical mowing, coring or slicing should be delayed for 7 days after application to allow proper translocation into underground plant parts.

For Maximum control of existing vegetation, delay establishment to determine if regrowth from escaped underground plant parts occurs. When repeat treatments are necessary, sufficient regrowth must be attained prior to application. Desirable turfgrass may be established following the above procedures.

10.5 INJECTION APPLICATIONS -- FOR ALL NON-CROPLAND USES

Woody vegetation may be controlled by injection application of this product. Apply using suitable equipment, which must penetrate into living tissue, at a rate of at least 0.33 millilitres (either undiluted or 1:1 with water) per 5 centimetres tree diameter at breast height (DBH). The cuts should be spaced evenly around the tree and below all major branches. Application may be made at any time of year, except when cold temperatures prevent adequate penetration of injection equipment, or in the spring during periods of heavy sap flow. Control of tree species with tree diameters greater than 20 centimetres may not be acceptable at this rate.

Total control may not be evident for 1 to 2 years following treatment.
A partial list of species controlled includes:

<table>

</tbody>
</table>

* This treatment may only provide suppression of Bigleaf Maple. Late fall applications will provide optimum suppression of Bigleaf Maple.

### 10.6 CUT STUMP APPLICATION

Woody vegetation may be controlled by the application of this product to freshly cut stumps to prevent regrowth. Because the treatment uses a concentrated solution, application must be made using low-pressure equipment e.g., squirt bottle or similar device. This product must be applied immediately to the surface of the freshly cut stump i.e., within 5 minutes for optimum control at the prescribed rates. Only the cambial tissues of the cut surface should be treated. Apply the herbicide solution at a rate equivalent to at least 0.33 millilitres product for every 5 centimetres DBH. Do not cover the remaining area nor any exposed roots, as this product does not penetrate bark well. This treatment may be used at any time of year, except during periods of heavy sap flow or when low temperatures prevent solution application due to freezing. A water soluble colourant may be added to the solution as a means of indicating which surfaces have been treated. Total control may not be evident until 1 to 2 years after treatment.

See “Injection Applications” (section 10.5) of this label for a partial list of species controlled.
